

LC75392, 75392M

Single-Chip Electronic Volume Control System

Overview

The LC75392 (DIP-30SD) and the LC75392M (MFP-30S) are electronic volume control ICs that provide input and output switching, volume, and tone control functions controlled by data transferred over a serial interface.

Functions

- Input and output switching: Four inputs and outputs can be switched independently.
- Volume control: A balance function can be implemented by controlling the left and right levels independently. Each channel can be set to 0 to -20 dB in 2 dB steps, -20 to -32 dB in 3 dB steps, -32 to -52 dB in 4 dB steps, -52 dB to -70 dB in 4.5 dB steps, and $-\infty$.
- Tone controls: Internal switches are provided to select between four sets of frequency characteristics. A buffer function can be implemented using external components.

Features

Serial data interface: Support for control and communication in the CCB format.

Control System Timing and Data Format

To control the LC75392, applications must apply data in the stipulated format to the CE, CL, and DI pins. This data consists of 32 bits, of which 8 bits are the address and 24 bits are the control data.

Usage Notes

- The states of the internal analog switches are undefined immediately after power is first applied. Applications should apply muting to the outputs of this IC using external circuits until the control data has been set up.
- The CL, DI, and CE pin lines should be shielded by the ground pattern or shielded lines should be used to prevent the high-frequency digital signals that are transmitted over these lines from entering the analog system as noise.
- We recommend that applications use a sequence of several smaller steps to approach the final setting when changing the value of the volume control setting significantly. For example, the sequence shown below should be used when changing from 0 dB to $-\infty$. This can reduce switching noise.

Example: 0 dB \rightarrow -10 dB \rightarrow -20 dB \rightarrow -40 dB \rightarrow -70 dB \rightarrow $-\infty$
