**CY29940**

2.5V or 3.3V, 200-MHz, 1:18 Clock Distribution Buffer

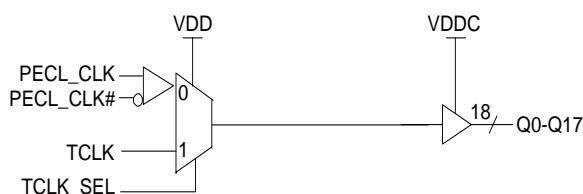

## Features

- 200-MHz clock support
- LVPECL or LVCMS/LVTTL clock input
- LVCMS/LVTTL compatible inputs
- 18 clock outputs: drive up to 36 clock lines
- 150 ps max. output-to-output skew
- Dual or single supply operation:
  - 3.3V core and 3.3V outputs
  - 3.3V core and 2.5V outputs
  - 2.5V core and 2.5V outputs
- Pin compatible with MPC940L, MPC9109
- Available in Commercial and Industrial temperature
- 32-pin LQFP package

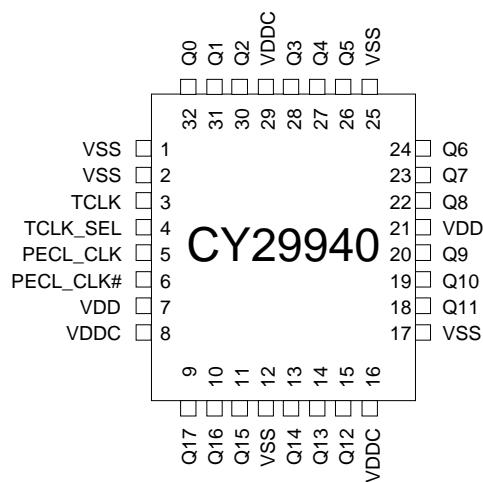

## Description

The CY29940 is a low-voltage 200-MHz clock distribution buffer with the capability to select either a differential LVPECL or a LVCMS/LVTTL compatible input clock. The two clock sources can be used to provide for a test clock as well as the primary system clock. All other control inputs are LVCMS/LVTTL compatible. The eighteen outputs are 2.5V or 3.3V LVCMS/LVTTL compatible and can drive 50Ω series or parallel terminated transmission lines. For series terminated transmission lines, each output can drive one or two traces giving the device an effective fanout of 1:36. Low output-to-output skews make the CY29940 an ideal clock distribution buffer for nested clock trees in the most demanding of synchronous systems.

## Maximum Ratings<sup>[2]</sup>

Maximum Input Voltage Relative to V<sub>SS</sub>: ..... V<sub>SS</sub> – 0.3V  
 Maximum Input Voltage Relative to V<sub>DD</sub>: ..... V<sub>DD</sub> + 0.3V  
 Storage Temperature: ..... –65°C to + 150°C  
 Operating Temperature: ..... –40°C to +85°C  
 Maximum ESD Protection ..... 2 kV  
 Maximum Power Supply: ..... 5.5V  
 Maximum Input Current: ..... ±20 mA

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, V<sub>in</sub> and V<sub>out</sub> should be constrained to the range:

$$V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either V<sub>SS</sub> or V<sub>DD</sub>).

**DC Parameters:** V<sub>DD</sub> = 3.3V ±5% or 2.5V ±5%, V<sub>DDC</sub> = 3.3V ±5% or 2.5V ±5%, T<sub>A</sub> = –40°C to +85°C

**Notes:**

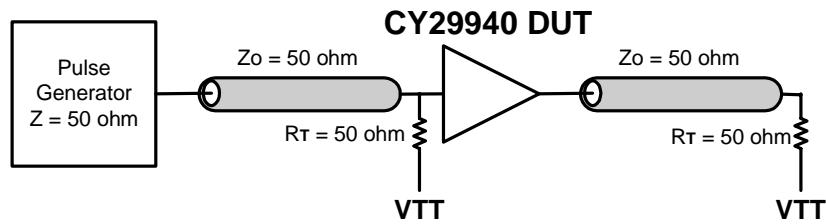

2. **Multiple Supplies:** The Voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
3. Inputs have pull-up/pull-down resistors that effect input current.
4. The V<sub>CMR</sub> is the difference from the most positive side of the differential input signal. Normal operation is obtained when the "High" input is within the V<sub>CMR</sub> range and the input lies within the V<sub>PP</sub> specification. Driving series or parallel terminated 50Ω (or 50Ω to V<sub>DD</sub>/2) transmission lines
5. Outputs driving 50Ω transmission lines.
6. See Figure 1 &2.
