**3-PHASE BRIDGE DRIVER**

The MPIC2130 is a high voltage, high speed, power MOSFET and IGBT driver with three independent high side and low side referenced output channels for 3-Phase applications. Proprietary HVIC technology enables ruggedized monolithic construction. Logic inputs are compatible with 5 V CMOS or LSTTL outputs. A ground referenced operational amplifier provides an analog feedback of bridge current via an external current sense resistor. A current trip function which terminates all six outputs is also derived from this resistor. An open drain FAULT signal is provided to indicate that an over-current or undervoltage shutdown has occurred. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction. Propagation delays are matched to simplify use in high frequency applications.

The floating channels can be used to drive N-channel power MOSFET or IGBT's in the high side configuration which operate from 10 to 600 volts.

- Floating Channel Designed for Bootstrap Operation
- Fully Operational to +600 V
- Tolerant to Negative Transient Voltage
- dV/dt Immune
- Gate Drive Supply Range from 10 to 20 V
- Undervoltage Lockout for All Channels
- Over-current Shut Down Turns Off All Six Drivers
- Independent Half-bridge Drivers
- Matched Propagation Delay for All Channels
- Outputs Out of Phase with Inputs
