

<b>SANYO</b>	No. 4612A	<b>STK4241II</b>
	<b>2ch AF Power Amplifier (Split Power Supply) (120W + 120W min, THD = 0.4%)</b>	

### Features

- Muting circuit built-in to isolate all types of shock noise
- Current mirror circuit for low 0.4% total harmonic distortion
- Pin compatible with the STK4201V series (THD = 0.08%) and the STK4141X series (THD = 0.02%)

### Package Dimensions

unit: mm

4086A

## Specifications

### Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC \text{ max}}$		$\pm 77$	V
Thermal resistance	$\theta_{j-c}$		1.0	$^\circ\text{C/W}$
Junction temperature	$T_j$		150	$^\circ\text{C}$
Operating substrate temperature	$T_c$		125	$^\circ\text{C}$
Storage temperature	$T_{stg}$		-30 to +125	$^\circ\text{C}$
Available time for load short-circuit	$t_s$	$V_{CC} = \pm 53\text{V}$ , $R_L = 8\Omega$ , $f = 50\text{Hz}$ , $P_O = 120\text{W}$	0.5	s

### Recommended Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	$V_{CC}$		$\pm 53$	V
Load resistance	$R_L$		8	$\Omega$

### Operating Characteristics at $T_a = 25^\circ\text{C}$ , $V_{CC} = \pm 53\text{V}$ , $R_L = 8\Omega$ (noninductive load), $R_g = 600\Omega$ , $V_G = 40\text{dB}$

Parameter	Symbol	Conditions	min	typ	max	Unit
Quiescent current	$I_{CCO}$	$V_{CC} = \pm 63.5\text{V}$	20	40	100	mA
Output power	$P_O$	THD = 0.4%, $f = 20\text{Hz}$ to 20kHz	120	-	-	W
Total harmonic distortion	THD	$P_O = 1.0\text{W}$ , $f = 1\text{kHz}$	-	-	0.3	%
Frequency response	$f_L, f_H$	$P_O = 1.0\text{W}$ , $+3$ $-3$ dB	-	20 to 50k	-	Hz
Input impedance	$r_i$	$P_O = 1.0\text{W}$ , $f = 1\text{kHz}$	-	55	-	k $\Omega$
Output noise voltage	$V_{NO}$	$V_{CC} = \pm 63.5\text{V}$ , $R_g = 10\text{k}\Omega$	-	-	1.2	mVrms
Neutral voltage	$V_N$	$V_{CC} = \pm 63.5\text{V}$	-70	0	+70	mV
Muting voltage	$V_M$		-2	-5	-10	V

**Notes.**

All tests are measured using a regulated voltage supply unless otherwise specified.

Available time for load short-circuit and output noise voltage are measured using the transformer supply specified below.

The output noise voltage is the peak value of an average-reading meter with an rms value scale (VTVM). A regulated AC supply (50Hz) should be used to eliminate the effects of AC primary line flicker noise.

### Specified Transformer Supply (MG-200 or Equivalent)

# STK4241II

## Equivalent Circuit

A01567

## Sample Application Circuit (120W min 2-Channel AF Power Amplifier)

Sample Application Circuit PCB Layout (Copper Foil Surface)

Unit (resistance: Ω, capacitance: F)

External Component Description

C3, C4	Input filter capacitors. These, together with R5 and R6, form filters to reduce high-band noise.
C5, C6	Input coupling capacitors. For DC blocking. Since capacitor reactance becomes larger at lower frequencies, the output noise can be adversely affected by signal source resistance-dependent 1/f noise. In this case, a lower reactance value should be chosen. In order to remove pop noise at power-on, larger values of capacitance should be chosen for C5 and C6, which determine the input time constant, and smaller values for C9 and C10 in the NF circuit.
C9, C10	NF capacitors. These determine the low-side cut-off frequency. $f_L = \frac{1}{2\pi \times C9 \times R7} \text{ [Hz]}$ A Large value should be chosen for C9 to maintain voltage gain at low frequencies. However, because this would tend to increase the shock noise at power-on, a value larger than absolutely necessary should be avoided.
C19	Decoupling capacitors. This removes shock noise and ripple voltage from the supply.
C15, C16	Bootstrap capacitors. If these capacitors are made small, then the total harmonic distortion at low frequencies increases significantly.
C17, C18	Oscillation prevention capacitors. These should be inserted as close as possible to the IC supply pins to reduce supply impedance and hence provide stable IC operation. Electrolytic capacitors are recommended.
C20	Ripple filter capacitor. This forms a ripple filter in combination with internal transistor TR10.
C13, C14	Oscillation prevention capacitors. Mylar capacitors are recommended for their excellent thermal and frequency characteristics.
R5, R6	Input filter resistors.
R3, R4	Input bias resistors. These are used to bias the input pins at zero potential. The input impedance is largely determined by this resistance.
R7, R9 (R8, R10)	Voltage-gain VG setting resistors. VG = 40dB is recommended using R7, R8 = 560Ω, and R9, R10 = 56kΩ. Gain adjustments are best made using R7 or R8. If gain adjustments are made using R7 or R8, then set R3, R4 = R9, R10 to maintain $V_N$ balance stability.
R11, R20 (R12, R21)	Bootstrap resistors. These resistors determine the quiescent current. Values of 4.7kΩ and 4.7kΩ are recommended.
