

## TV Encoder

### GENERAL DESCRIPTION

The CS8553 provides full conversion from digital video format YCbCr into NTSC/PAL composite. It can be used in VCD, DVD, and digital VCR applications.

Two times oversampling reduces the output filter requirements and guarantees no alias interference by internal UV filters and Y filter.

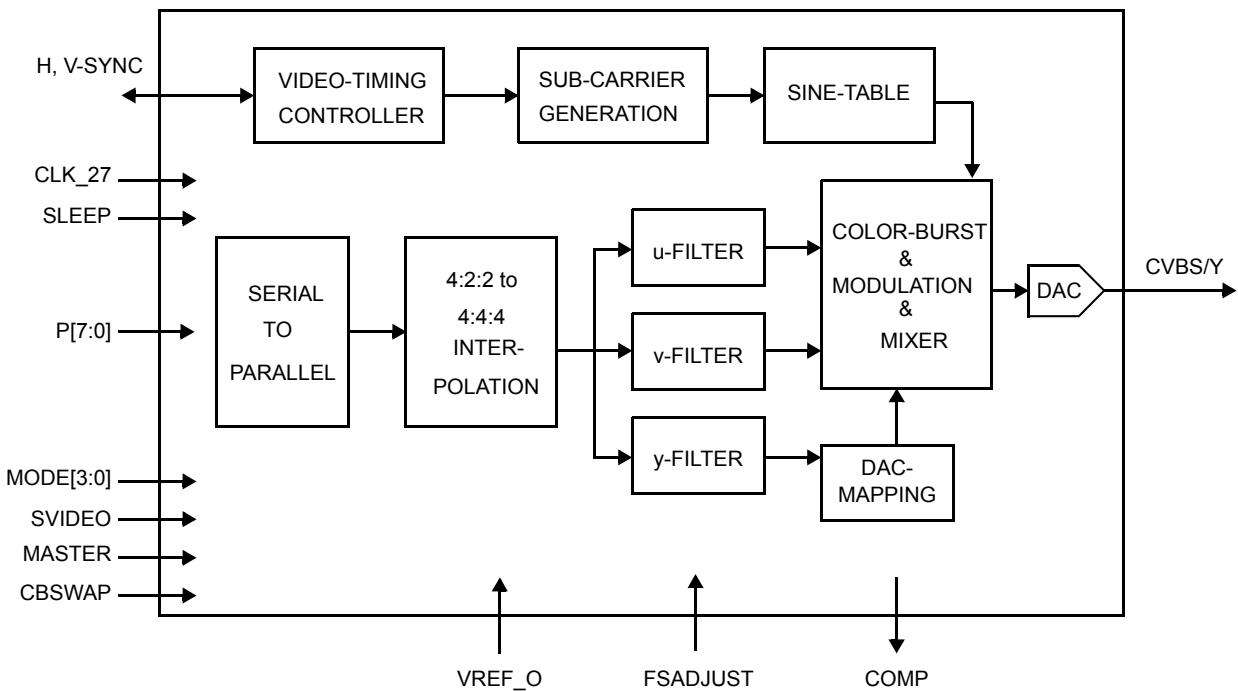

A 9-bit DAC provides a composite video output with high quality image.

32-pin package and pin assignment make the CS8553 compatible with major vendors.

### FEATURES

- Especially designed for VCD, Karaoke, digital VCR, DVD, DIGITAL set-top box.
- Supports the following 4 modes:  
NTSC, PAL-M, PAL-BDGHI, PAL-Nc.
- 8-bit 4:2:2 YCbCr inputs for glueless interface to MPEG decoders.
- CVBS (composite YC) outputs.
- Supports CCIR-601 format, non-square pixel
- 2x oversampling simplifying external filtering.
- 6MHz and 1.3MHz anti-alias filters for Y and U/V channels each.
- 1 channel of 9-bit DAC.
- Supports master and slave modes.
- Supports interlace operation only.
- Automatic mode detection/switiching in slave mode.
- 3.3V supply voltage; 5V tolerant for all digital I/O pins.

PIN CONNECTION DIAGRAM

Figure-1 32-pin TQFP

PIN DESCRIPTION

Name	I/O	TQFP Pin No.	Description
CLK_27	I	25	Pixel clock, 27MHz, twice the Y sample rate
VSYNC	I/O	28	Vertical sync, output in master mode or input in slave mode, is synchronized by CLK.
H SYNC	I/O	29	Horizontal sync, output in master mode or input in slave mode, is synchronized by CLK too.
P[7:0]	I	24-17	YCbCr pixel inputs (TTL compatible). Also, synchronized by CLK with respect to the incoming HSYNC timing, the higher index corresponds to a greater significance.
MD[3:0]	I	13-16	Configuration inputs
MASTER	I	12	in 0: slave mode, h and v sync are inputs. 1: master mode, h and v sync are outputs.
CBSWAP	I	11	0: normal Cr, Cb sequence. 1: swaps Cr, Cb sequence
SVIDEO	I	10	Connected to VSS.
SLEEP	I	9	1: power down, reset 0: normal operation
FSADJUST	I	1	Full scale adjust control pin. A resistor RSET is connected to GND. Used to control the full-scale output current on analog outputs.
COMP	I	2	Compensation pin. A 0.1μF capacitor is used to bypass this pin to VCC.
VREFO	I	4	Voltage reference output, typically 1.2V, may be used to connect to VREFI input.
VREFI/VRDAC	I	5	Voltage reference input, typically 1.235V. A 0.11μF capacitor must be used to decouple this input to GND. DAC current switch reference input, connect to VREFO output.
NC	O	6	No connection
NC	O	7	No connection
CVBS/Y	O	32	Composite output or luminance (with blanking and sync)
VAA		3	Analog power
VDD		27	Digital power
GND		26	Digital ground
AGND		31,8	Analog ground
VSS		30	Analog ground

## FUNCTIONAL DESCRIPTION

### MODE configuration

See **Table 1** to **Table 3** for details.

master = 1: master mode

Horizontal sync and vertical sync are generated from internal timing and are output at the rising edge of clk\_27.

md[3]: Defines EFIELD function

0: vsync is output pin

1: vsync is even/odd field indicator, vsync=0 even, vsync=1 odd.

md[2]: Defines PAL625 function

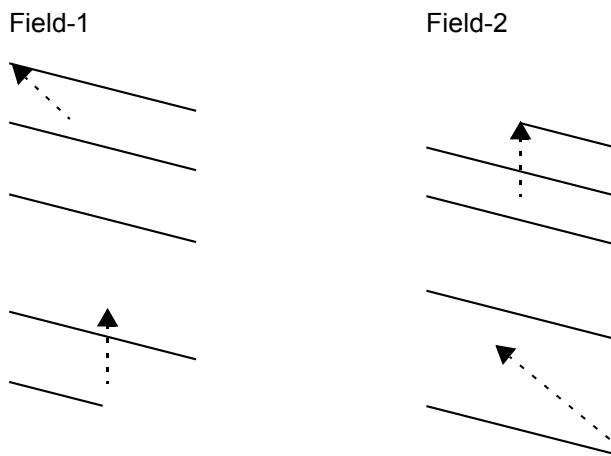

0: 525-line operation is set.

1: 626-line operation is set.

master = 0: slave mode

Horizontal sync and vertical sync are inputs that are synchronized by clk\_27.

A falling edge of VSYNC\* occurring within  $\pm 1/4$  of a scan line from the falling edge of HSYNC\* cycle time indicates the beginning of Field-1. A falling edge of VSYNC\* occurring within  $\pm 1/4$  of a scan line from the middle point of the line indicates the beginning of Field-2. See **Figure 2**.

**Figure-2**

md[3]: Defines YCSWAP

0: normal operation.

1: Swap the luma and chroma samples.

md[2]: Defines SETUP function

0: 7.5 IRE setup is enabled for NTSC and PAL-M, with scaling for 92.5% black-to-white range, other PALs with normal 100% black-to-white range.

1: 7.5 IRE setup is disabled for NTSC and PAL-M, with scaling for 100% black-to-white range.

md[1]: Defines Palsa function, South America.

0: Normal operation.

1: PAL-M used for Brazil 525 lines operation. PAL-Nc used for Argentina 625 lines operation.

**Table-1**

Mode	Mode[3]	Mode[2]	Mode[1]	Mode[0]
Slave	YCSWAP	SETUP	PALSA	RESERVED
Master	EFIELD	PAL625	RESERVED	RESERVED

EFIELD	EFIELD is used when configured as a master. When EFIELD is set low, the Normal vsync* signal is output on the VSYNC* pin. When EFIELD is set high, field ID information is output on the VSYNC* pin (VSYNC* low for Field-1 and high for Field-2)
PAL625	PAL625 is used when configured as a master. When PAL625 is set low, 525-line operation is selected. When PAL625 is set high, 625-line operation is selected. This mode is set by automatic detection when configured as a slave.
YCSWAP	YCSWAP should normally be set to zero. When configured as a slave, this bit can be set high to swap the luma and chroma samples, thus altering the pixel sequence with respect to the incoming HSYNC* timing reference.
SETUP	SETUP is normally low for the common video modes. The setup and scaling function is toggled when this bit is high. When SETUP is low, the 7.5IRE setup is enabled for NTSC and PAL-M with scaling amplified for a 92.5% black-to-white range. When SETUP is high, the 7.5 IRE setup is disabled for NTSC and PAL-M with 100% black-to-white range scaling. Other PAL formats have setup disabled with normal 100% scaling.
PALSA	PALSA is normally low for the common video modes. South American video Standards can be enabled by setting this bit high. For 525-line operation, the PALSA enables PAL-M for Brazil; in 625-line operation, the PALSA enables PAL-Nc for Argentina.

**Table-2 Master mode:**

master	Mode[3:0]	System	PAL-625	PALSA	Fv Hz	Fh Hz
1	X000	(Normal setup) NTSC	0	0	59.94	15734.26
0 ↓ 1	X010 X010 X010	PAL-M	0	1	59.94	15734.26
1	X100	PAL-BDGHI	1	0	50.00	15625
0 ↓ 1	X010 X010 X110	PAL-Nc	1	1	50.00	15625

**Table-3 Slave mode:**

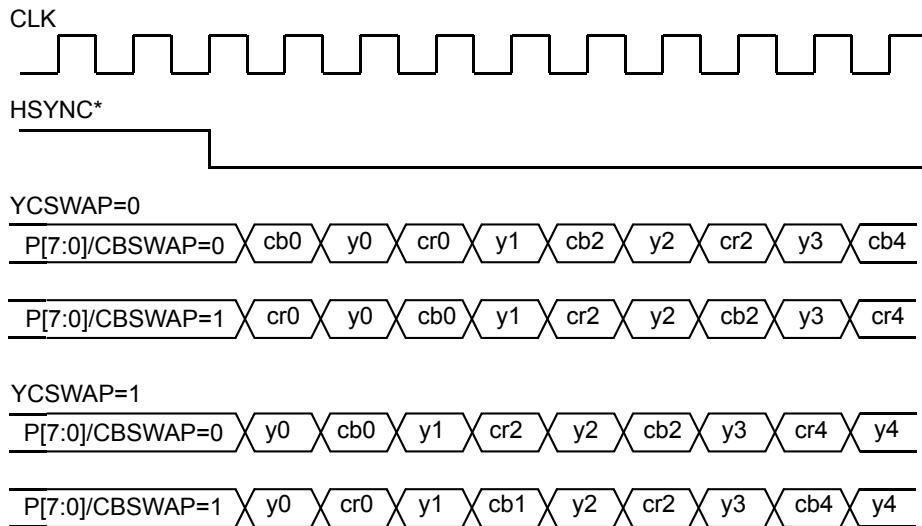

Master	Mode[3:0]	System	PAL-625	PALSA	Fv hz	Fh Hz
0	X000	NTSC	0	0	59.94	15734.26
0	X010	PAL-M	0	1	59.94	15734.26
0	X000	PAL-BDGHI	1	0	50.00	15625
0	X010	PAL-Nc	1	1	50.00	15625

**PIXEL INPUT/OUTPUT TIMING**

1. Clk is 2x the luminance sampling rate (13.5 MHz) or 4x the chrominance sampling rate (6.75 MHz), all signals are reference to rising edge.
2. In accordance with CCIR656, the input pixel pattern begins during the first clk period after the falling edge of HSYNC (same for master mode and slave mode). The input pattern is Cb0, Y0, Cr0, Y1, Cb2, Y2, Cr2, Y3,..... The input pin CBSWAP and md[3] (YCSWAP) could be used to swap cb, cr sequence and also y and cb, cr sequence. See **Figure 3** and **Figure 4**.
3. Pixel input range: See **Table 4**.
  - Y: 16-235 for normal range; 0-15, 236-255 are invalid. When Y value is between 0-15, clamp to 16; when the Y value is between 236-255, Y is set to 235.
  - CbCr: 16-240 for normal range with 128 mapped to 0; 0-15, 241-255 are invalid. When Cb/Cr is between 0-15, clamp to 16; when Cb/Cr is 241 to 255, Y is set to 240.

**Table-4 75% amplitude, 100% saturated YCbCr color bars**

element	range	White	Yellow	Cyan	Green	Magenta	Red	Blue	black
Y	16-235	235	162	131	112	84	65	35	16
Cb	16-240	128	44	156	72	184	100	212	128
Cr	16-240	128	142	44	58	198	212	114	128

**Figure-3 Master Mode**

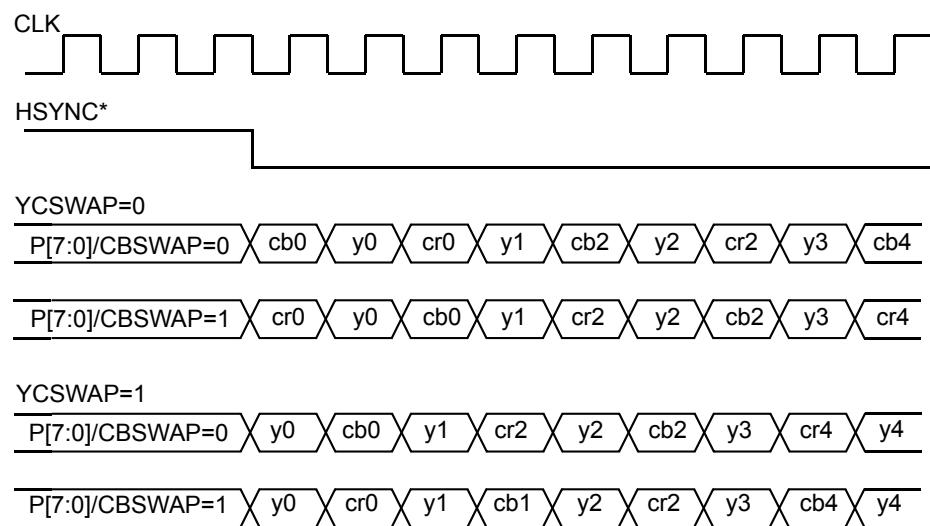

Figure-4 Slave Mode

## VIDEO TIMING

See **Table 5**, **Table 6**

1. If master mode is selected, horizontal counter is incremented on rising edge of clk-27, and reset to 1 when h-total is hit. Vertical counter is incremented by every horizontal scan line and reset to 1 after v-total hit. The output vertical sync is 3 or 2.5 lines for 262/525 and 312/625 later.
2. If slave mode is selected, the horizontal counter is incremented on the rising of clk-27 and then reset to 1 after 2 clk cycles late of falling edge of hsync. The vertical counter is incremented on the falling edge of hsync and reset to 1 at falling edge of vertical sync occurring within [-1/4, 1/4] of a scan line from the falling edge of hsync.
3. If the falling edge of vertical sync occurring within [-1/4, 1/4] of a scan line from the falling edge of hsync indicates the even field, if within [-1/4, 1/4] of middle point of scan line indicates odd field.
4. The width of horizontal sync and the start and end of color burst is automatically calculated and inserted for each mode.
5. Sync timing and burst envelopes are internally controlled. Color burst frequency is derived from the clock. Any jitter on clock may induce a color burst frequency error.
6. Timing tables:

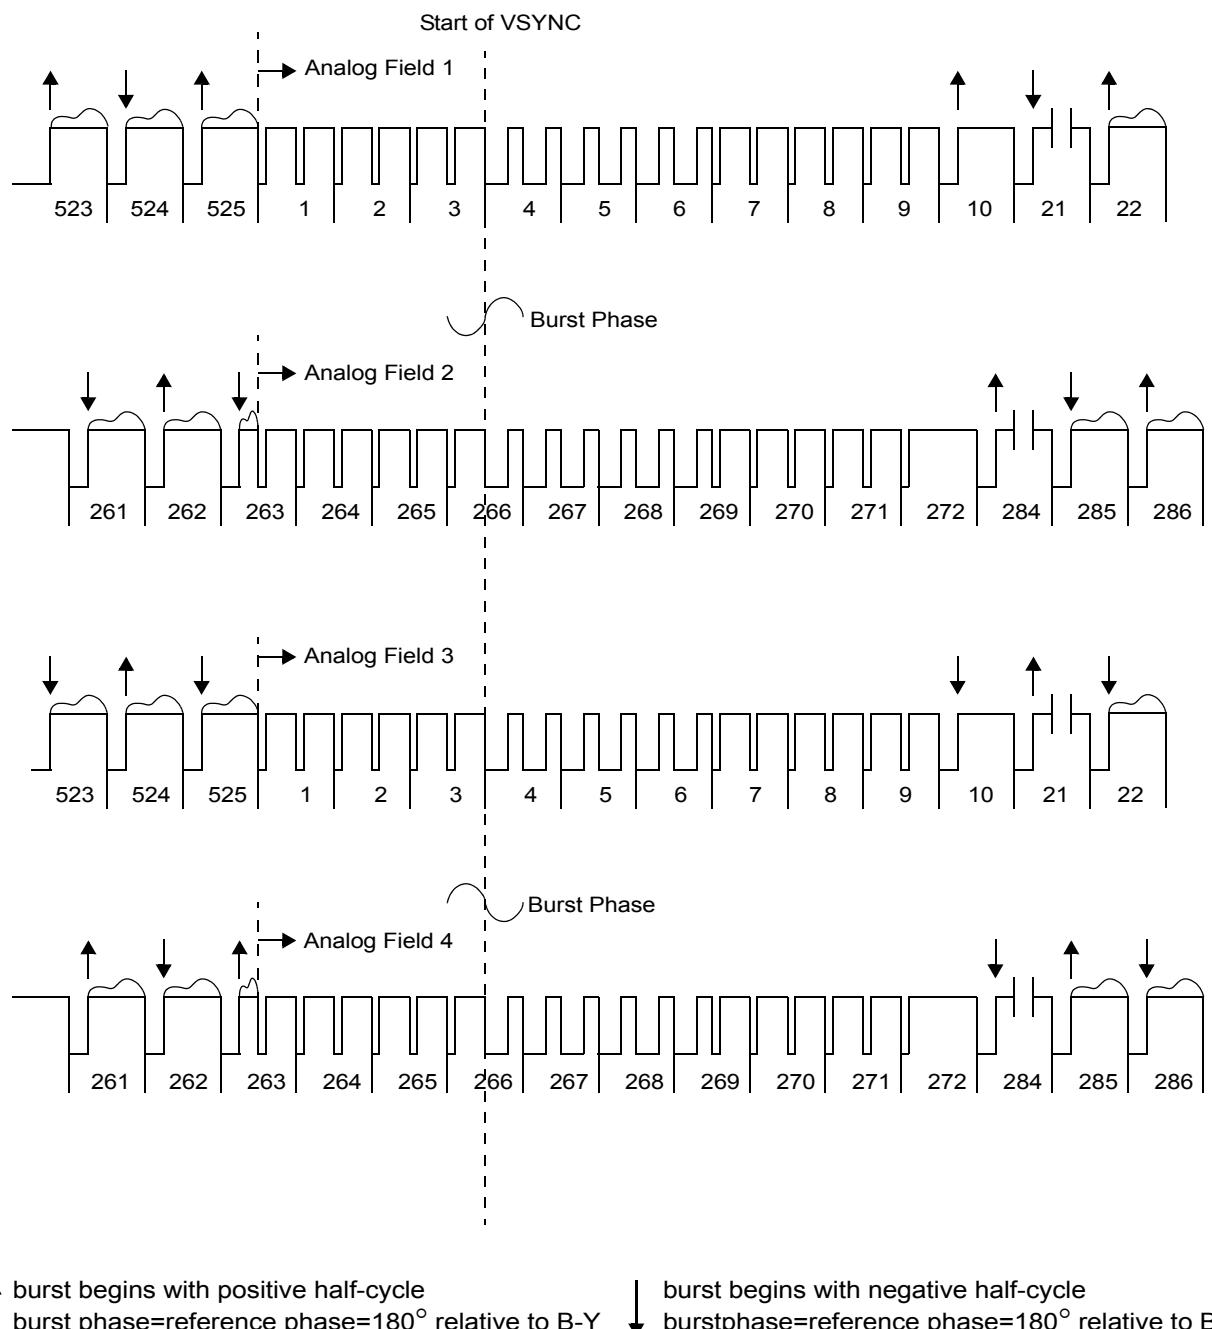

**Table-5** Vertical timing table

System	Odd-field Non-active	Odd-field Active	Even-field Non-active	Even-field Active	Total size	Active size
NTSC	Line 1-22	Line 23-262	Line 263-284; 524	Line 285-525	858*525	720*480
PAL-BDGHI	Line 1-22, 311, 312	Line 23-310	Line 311-335; 624, 625	Line 336-623	864*625	720*575

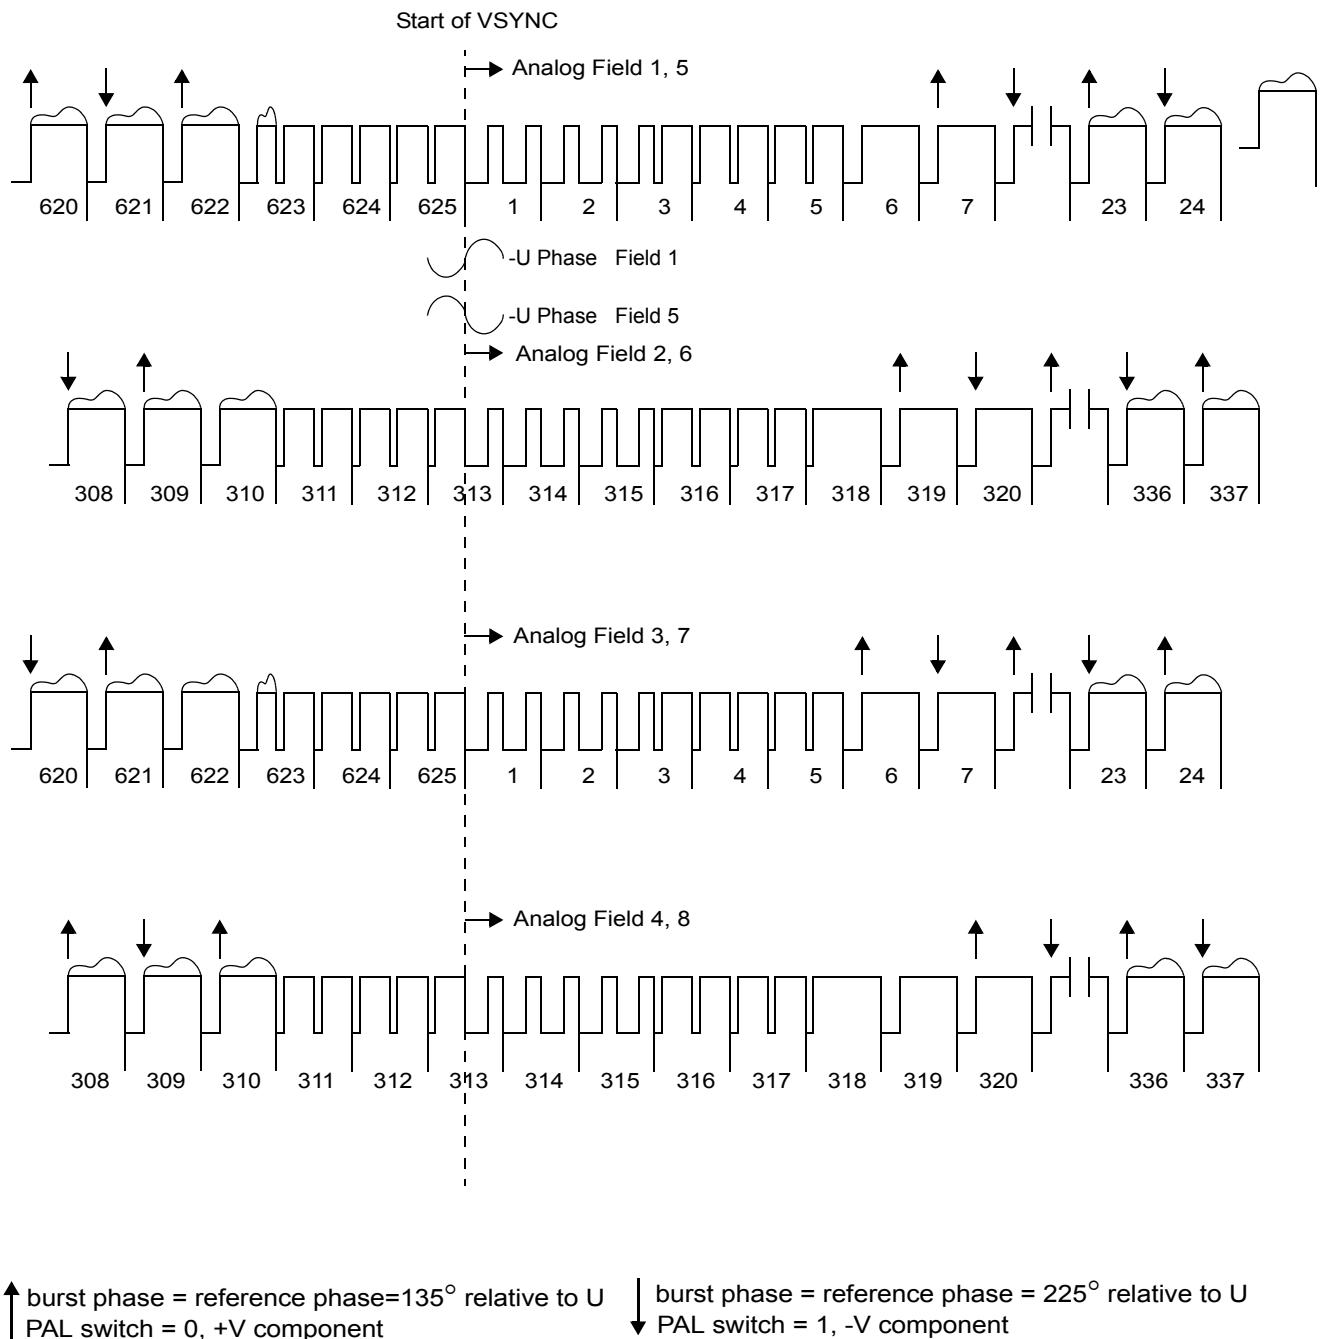

**Table-6** Horizontal timing table: number of 13.5 MHz cycles

System	Front-porch	Back-porch	Active	Burst-start	Burst-width	total
NTSC	20	127	711	72	34	858
PAL-M	20	127	711	78	34	858
PAL-BDGHI	20	142	702	76	30	864
PAL-Nc	20	142	702	76	34	864

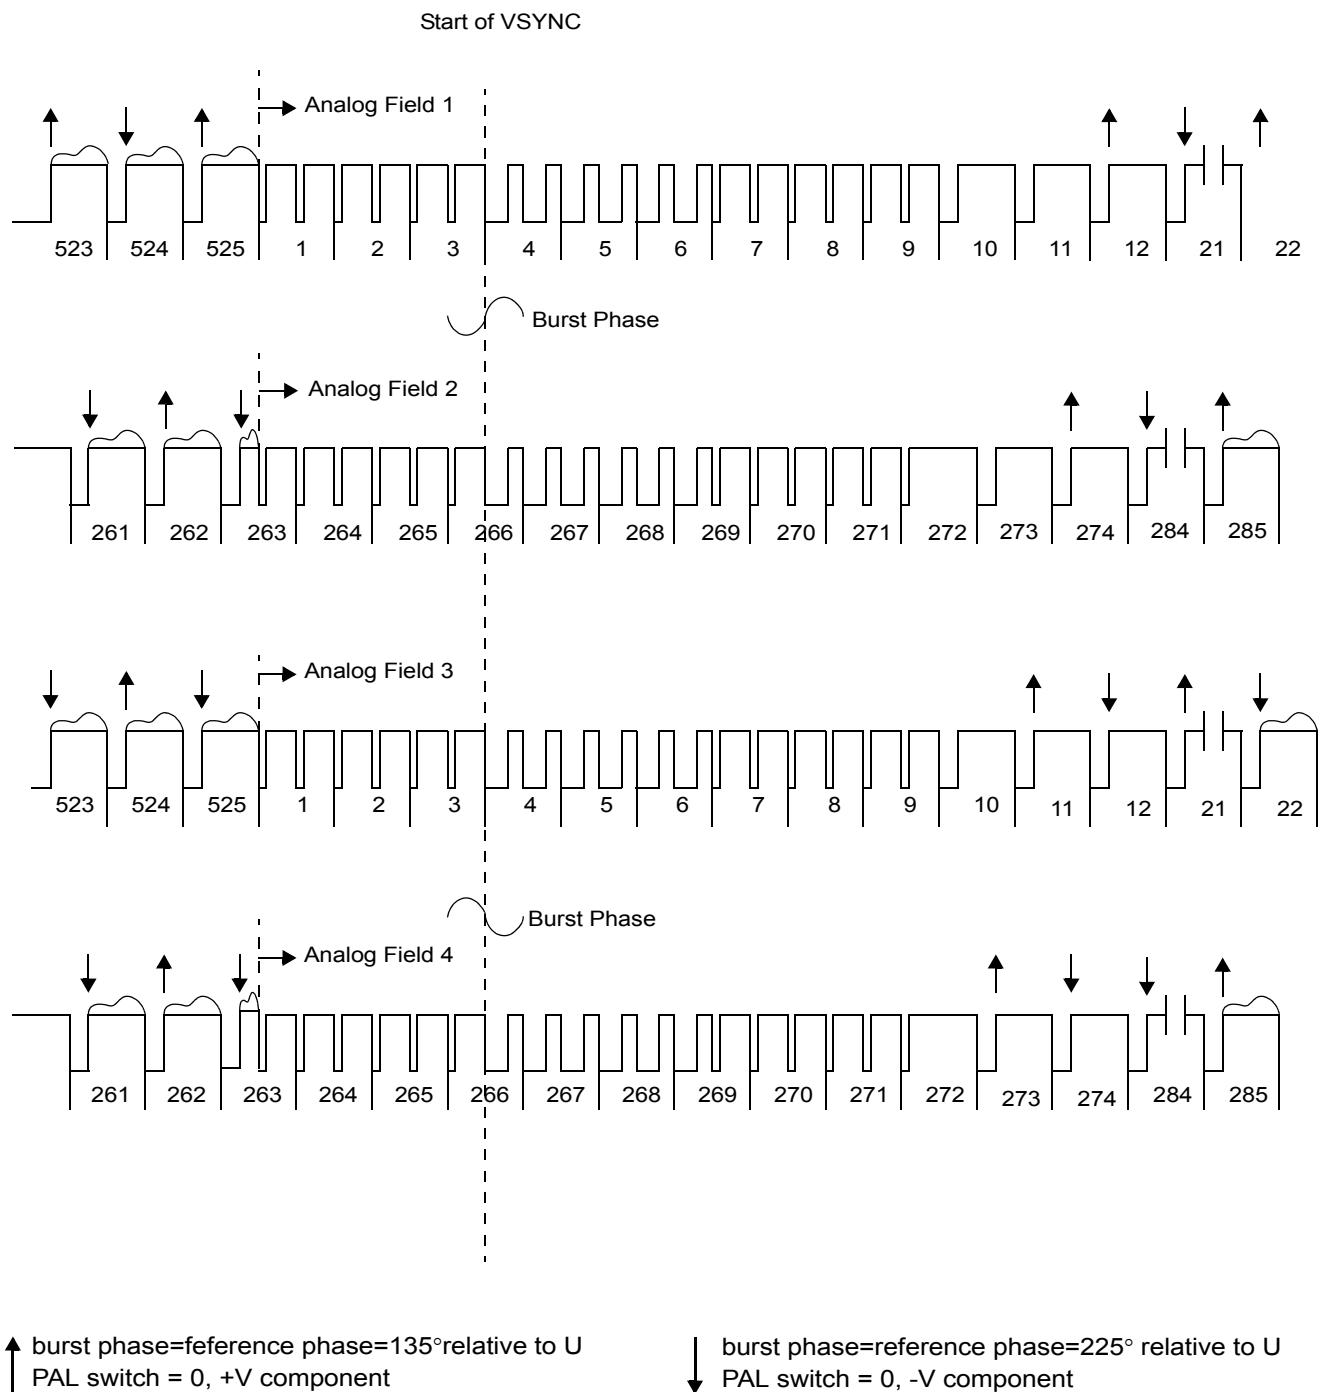

7. Color burst is disabled on appropriate scan lines. Serration and equalization pulses are generated on appropriate scan lines. For NTSC, color burst information is automatically disabled on scan line 1-9 and 264-272. For PAL-M, color burst information is automatically disabled on scan line 1-11 and 264-273 for field 1, 2, 5, and 6. However, for field 3, 4, 7 and 8, burst is disabled at scan line 1-10, 264-272. For PAL-BDGHIInc, color burst information is automatically disabled on scan line 1-6 and 310-318 and 623-625 for field 1,2,5,6. However, for field 3,4,7,8 burst is disabled at scan line 1-5,311-319,622-625. See the following **Figure 5**, **Figure 6** and **Figure 7**.

**Figure-5 Interface 525-line (NTSC) video timing**

**Figure-6 Interface 625-line (PAL-B,D,G,H,I,N,Nc) video timing**

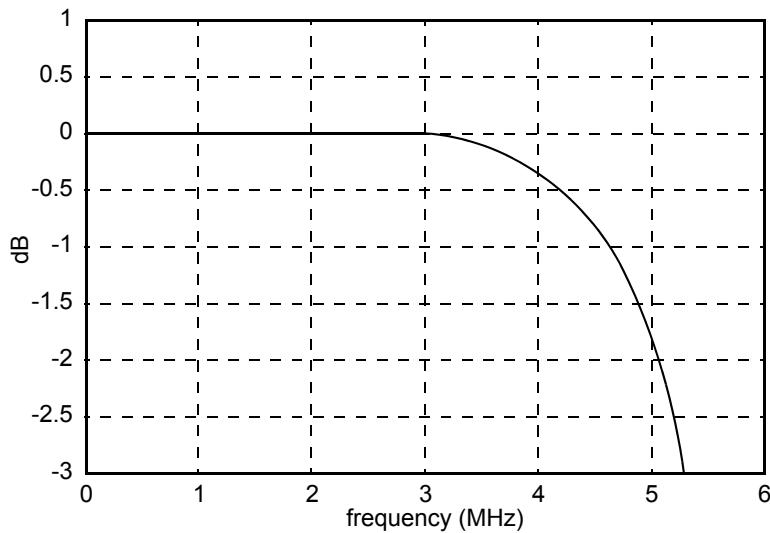

**Figure-7 Interlace 525-line (PALM) video timing**

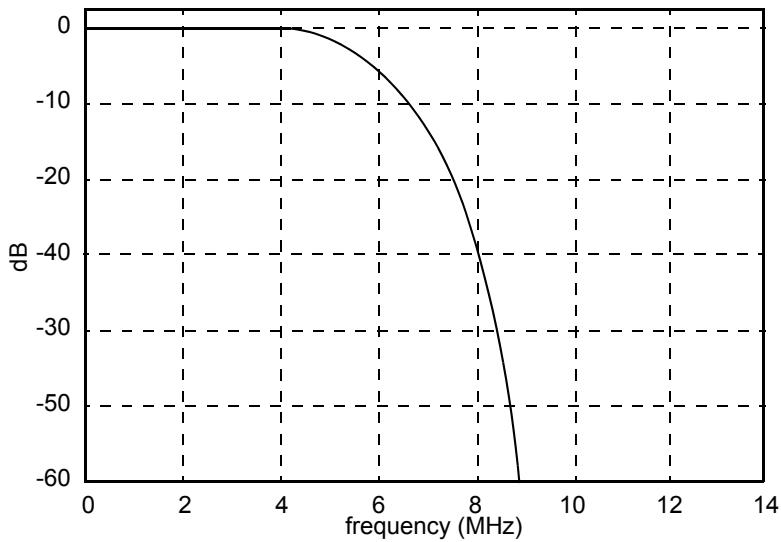

### ANTI-ALIAS FILTERS CHARACTERISTICS

The Y and the U, V are up-samples to clk, 27MHz after 4:2:2 to 4:4:4 conversion. Y is filtered by a filter whose passband is 6MHz. And U, V are also filtered by passband = 1.3MHz filters.

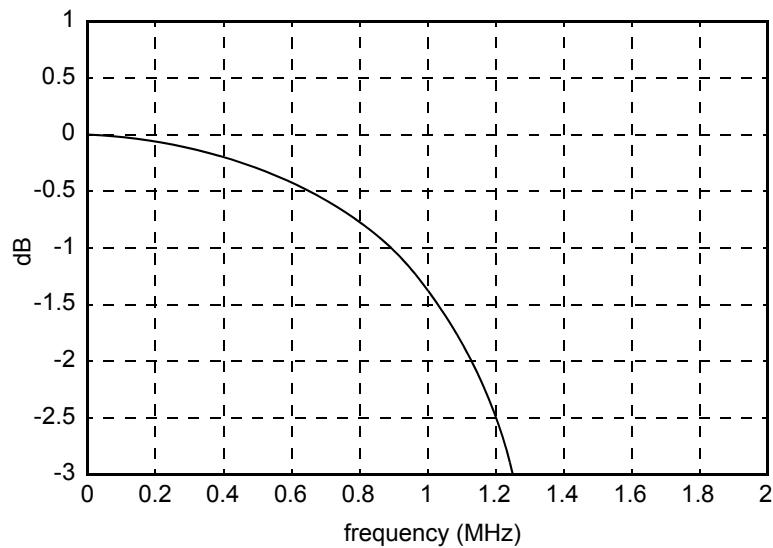

Please refer to **Figure 8** to **Figure 11**

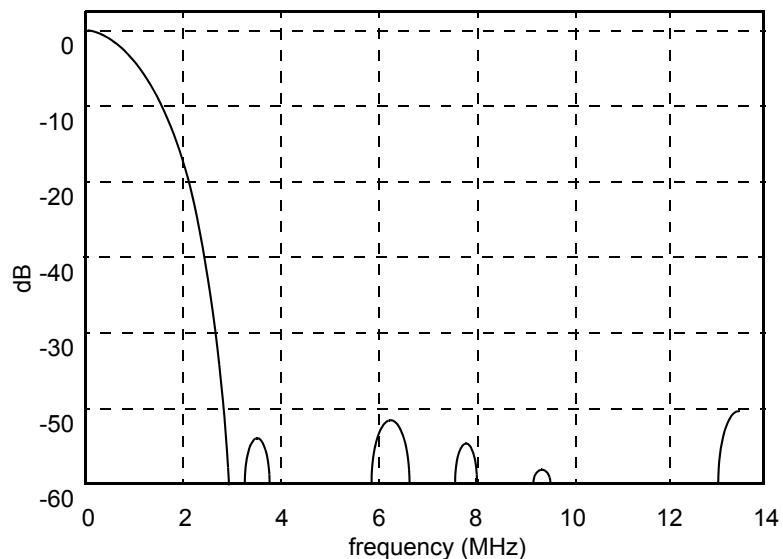

**Figure-8 2X Sample Y filter frequency response/passband**

**Figure-9 2X Sample Y filter frequency response/stopband**

**Figure-10 2X U/V filter frequency response/passband**

**Figure-11 2X U/V filter frequency response/stopband**

## DAC MAPPING

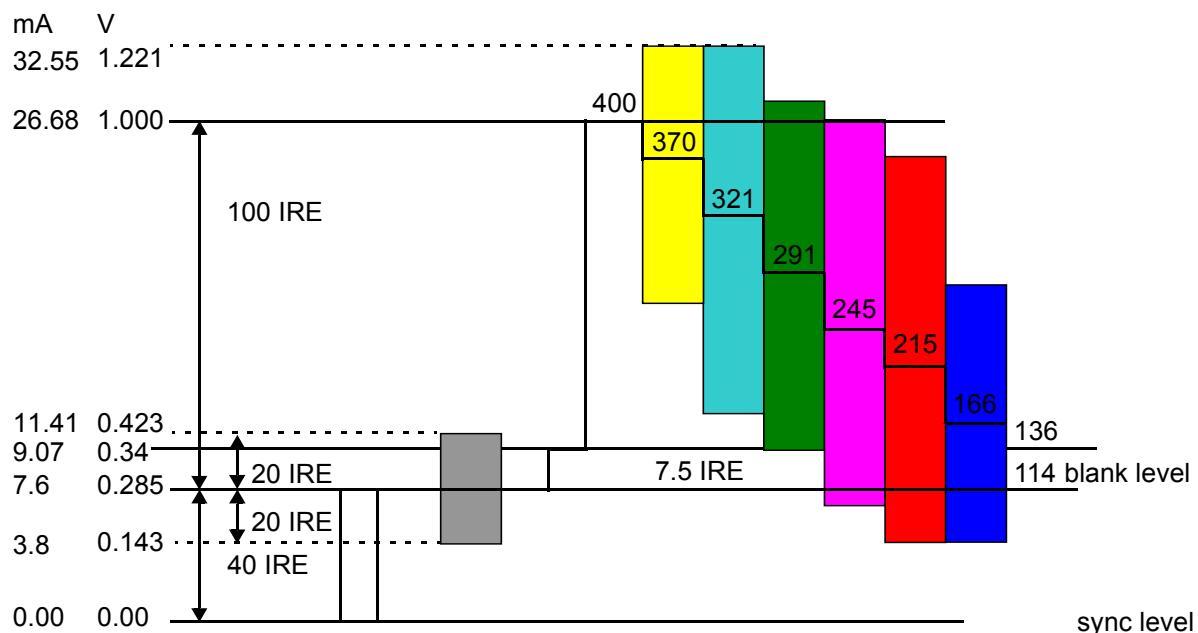

Depends on the video output mode, the color bars mapping to DAC are specified in **Table 7**, **Table 8** and **Figure 12, Figure 13**. Where white is 400. For PAL-BDGHINc blank = 120. For NTSC/PAL-M blank = 114 (setup = 0), 1 IRE = 2.857; if setup = 1, blank = 112, 1 IRE = 2.8.

**Table-7 composite NTSC/PAL 525**

Typical with  $37.5\Omega$  load,  $v_{ref\_o} = v_{ref\_i}$ , SETUP = 0

100% saturation color bars.

Description	DAC data	Sync interval
Peak C (high)	488	0
White	400	0
Burst (high)	171	0
Black	136	0
Blank	114	0
Burst (low)	57	0
Peak C (low)	48	0
Sync	0	1

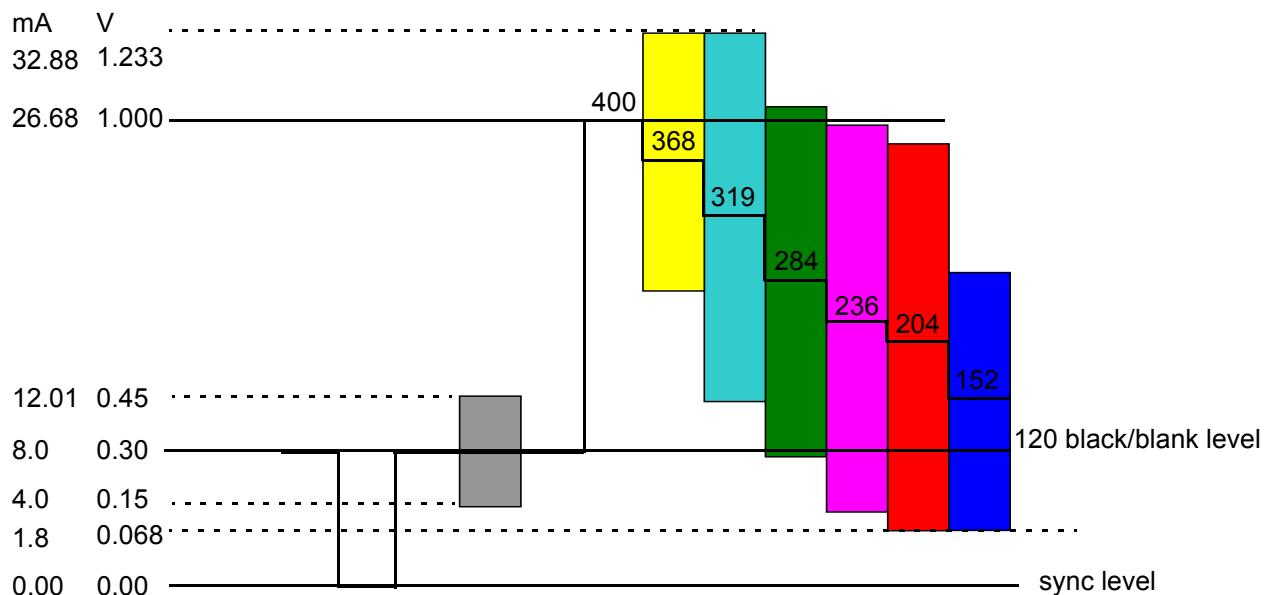

**Figure-12 colors, composite NTSC/PAL 525 video output waveform**

**Table-8 composite PAL-BDGHINc 625**

 Typical with  $37.5\Omega$  load,  $v_{ref\_o} = v_{ref\_i}$ , SETUP = 0

100% saturation (100/0/100/0) color bars.

Description	DAC data	Sync interval
Peak C (high)	493	0
White	400	0
Burst (high)	180	0
Black	120	0
Blank	120	0
Burst (low)	60	0
Peak C (low)	27	0
Sync	0	1
