# Dual 256-Tap, Low-Drift, Digital Potentiometers in 10- $\mu$ MAX

## General Description

The MAX5403/MAX5404/MAX5405 is a family of dual linear taper digital potentiometers. Each device has one 3-terminal potentiometer and one 2-terminal variable resistor (Figure 1). The MAX5403/MAX5404/MAX5405 operate from +2.7V to +5.5V single-supply voltages and use an ultra-low supply current of 0.1 $\mu$ A. These devices also provide glitchless switching between resistors taps as well as a convenient power-on reset (POR) that sets the wiper to the midscale position at power-up. The potentiometer consists of a fixed resistor with a wiper contact that is digitally controlled through a 3-wire serial interface and has 256-tap points. It performs the same function as a discrete potentiometer or variable resistor.

These parts are ideal for applications requiring digitally controlled resistors. Three resistance values are available: 10k $\Omega$  (MAX5403), 50k $\Omega$  (MAX5404), and 100k $\Omega$  (MAX5405). A nominal resistor-temperature coefficient of 35ppm/ $^{\circ}$ C end-to-end and 5ppm/ $^{\circ}$ C ratiometric make the MAX5403/MAX5404/MAX5405 ideal for applications requiring low temperature-coefficient variable resistors, such as adjustable-gain circuit configurations.

The MAX5403/MAX5404/MAX5405 are available in a 10-pin  $\mu$ MAX package. Each device is guaranteed over the extended industrial temperature range (-40 $^{\circ}$ C to +85 $^{\circ}$ C).

## Applications

Mechanical Potentiometer Replacement  
 Low-Drift Programmable Gain Amplifier (PGA)  
 Volume Control  
 LCD Screen Adjustment  
 Adjustable Voltage Reference  
 Programmable Filters, Delays, Time Constant  
 Impedance Matching

*SPI is a registered trademark of Motorola, Inc.*

## Features

- ◆ 10-Pin  $\mu$ MAX Small Footprint Package
- ◆ 256-Tap Positions
- ◆ Ultra Low 0.1 $\mu$ A Supply Current
- ◆ +2.7V to +5.5V Single-Supply Operation
- ◆ Low End-To-End Temperature Coefficient: 35ppm/ $^{\circ}$ C
- ◆ Low Ratiometric Temperature Coefficient: 5ppm/ $^{\circ}$ C
- ◆ Power-On Reset: Wiper Goes to Midscale (Position 128)
- ◆ Glitchless Switching Between Resistor Taps
- ◆ 3-Wire SPI™ -Interface Compatible
- ◆ 10k $\Omega$ /50k $\Omega$ /100k $\Omega$  Resistor Values

## Ordering Information

$\overline{CS}$ Pulse Width High	$t_{CSW}$		100			ns
<b>POWER SUPPLIES</b>						
Supply Voltage	$V_{DD}$		2.7		5.5	V
Supply Current	$I_{DD}$	$\overline{CS} = SCLK = DIN = V_{DD}$	$V_{DD} = +5V$	0.8	5	$\mu A$
			$V_{DD} = +2.7V$	0.1		$\mu A$

**Note 1:** Linearity is defined in terms of the  $H_X$  to  $L_X$  code-dependent resistance.

**Note 2:** The DNL and INL are measured with the potentiometer configured as a voltage divider with  $H_X = V_{DD}$  and  $L_X = 0$ . The wiper terminal is unloaded and measured with an ideal voltmeter.

**Note 3:** The DNL and INL are measured with the potentiometer configured as a variable resistor. For the 3-terminal potentiometer (Pot A),  $H_A$  is unconnected and  $L_A = 0$ . For the 2-terminal potentiometer (Pot B), only  $L_B = 0$ . At  $V_{DD} = +5V$ , the wiper terminal is driven with a source current of 400 $\mu A$  for the 10k $\Omega$  configuration, 80 $\mu A$  for the 50k $\Omega$  configuration, and 40 $\mu A$  for the 100k $\Omega$  configuration. At  $V_{DD} = +3V$ , 200 $\mu A$ /40 $\mu A$ /20 $\mu A$  for 10k $\Omega$ /50k $\Omega$ /100k $\Omega$  configuration respectively.

**Note 4:** The wiper resistance is the worst value measured by injecting into  $W_X$ , a current  $I_W = V_{DD} / R_{HL}$ .

**Note 5:** Digital timing is guaranteed by design.

## Pin Description

MAX5403/MAX5404/MAX5405

PIN	NAME	FUNCTION
1	GND	Ground
2	L <sub>B</sub>	Low Terminal of Resistor B
3	H <sub>B</sub>	High Terminal of Resistor B
4	W <sub>B</sub>	Wiper Terminal of Resistor B
5	$\overline{CS}$	SPI Chip Select
6	DIN	SPI Serial Data Input
7	SCLK	SPI Clock Input
8	V <sub>DD</sub>	Power Supply, +2.7V to +5.5V. Connect a 0.1 $\mu$ F capacitor to GND.
9	W <sub>A</sub>	Wiper Terminal of Resistor A
10	L <sub>A</sub>	Low Terminal of Resistor A

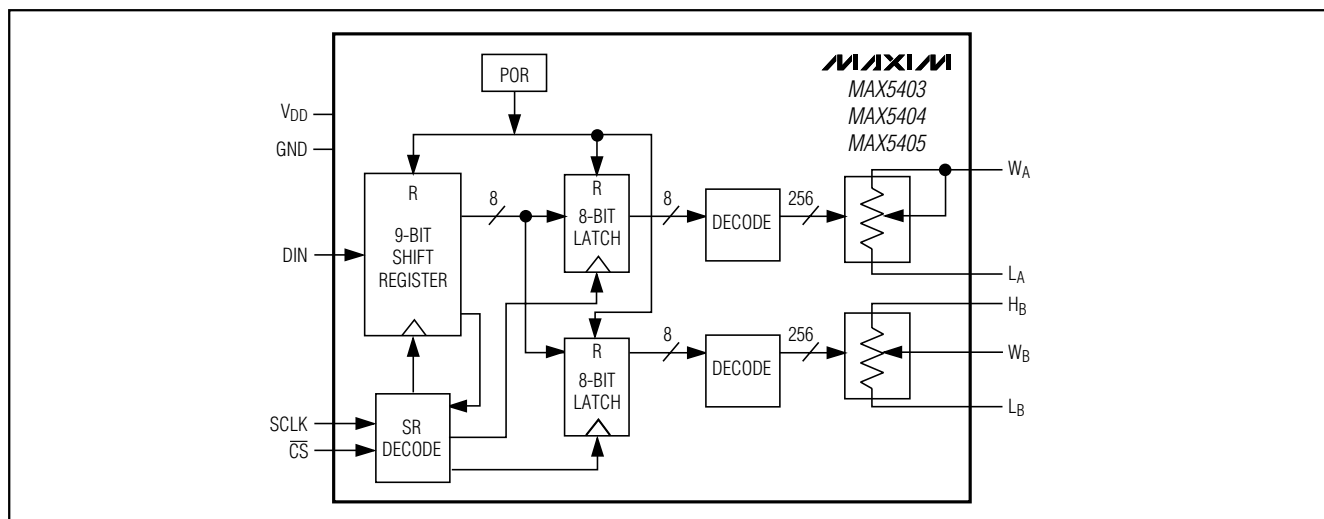

Figure 1. MAX5403/MAX5404/MAX5405 Functional Diagram: 2-Terminal Variable Resistor and 3-Terminal Potentiometers in 10- $\mu$ MAX Configuration

## Detailed Description

Each potentiometer consists of 255 fixed resistors in series between pins H<sub>B</sub> and L<sub>B</sub> for the 3-terminal potentiometer and between W<sub>A</sub> and L<sub>A</sub> for the 2-terminal variable resistor (Figure 1). The potentiometer wiper (pin W<sub>x</sub>) can be programmed to access any one of the 256 different tap points on the resistor string. The MAX5403/MAX5404/MAX5405 require nine bits to program the wiper position. The 1st bit is an address code,

allowing one or the other potentiometers to be selected for programming. The potentiometers are programmed independently of each other.

The MAX5403/MAX5404/MAX5405 use a 3-wire serial data interface to control the wiper tap position. This write-only interface contains three inputs: Chip Select ( $\overline{CS}$ ), Data In (DIN), and Data Clock (SCLK). When  $\overline{CS}$  is taken low, data from the DIN pin is synchronously loaded into the serial shift register on each rising edge

## Dual 256-Tap, Low-Drift, Digital Potentiometers in 10- $\mu$ MAX

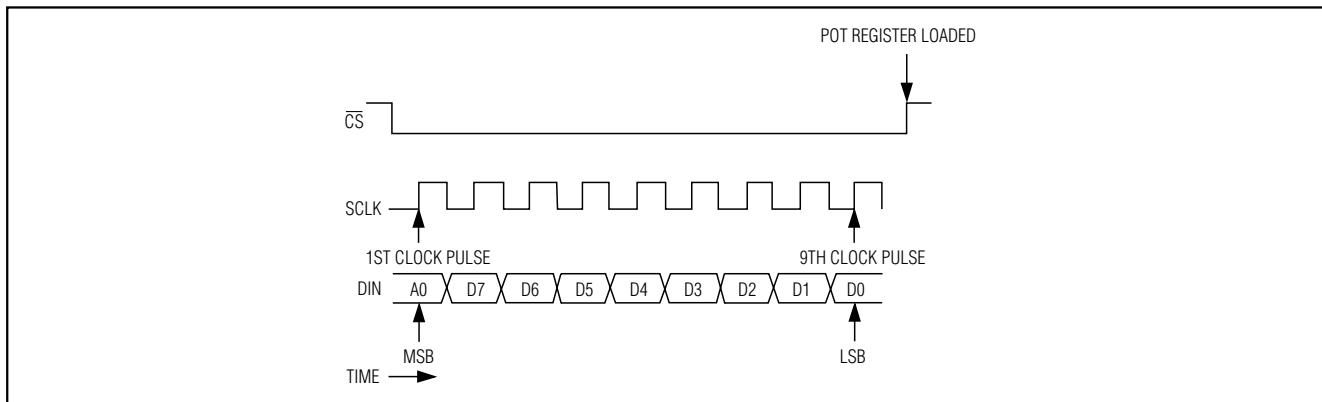

Figure 2. Potentiometer Serial Data Timing Circuit

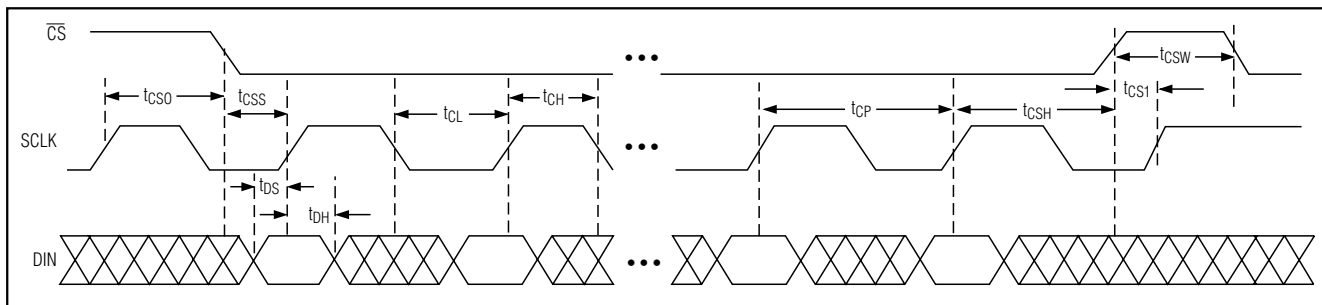

Figure 3. Detailed Serial Interface Timing Diagram

of each SCLK pulse (Figure 2). After all the data bits have been shifted in, they are latched into the appropriate potentiometer control register when  $\overline{CS}$  transitions from low to high. Note that if  $\overline{CS}$  is not kept low during the entire data stream, the data will be corrupted and the device will need to be reloaded.

The first bit A0 (address bit) is used to address one or the other of the potentiometers for programming. Potentiometer control register A is selected for writing when A0 is 'zero', and potentiometer control register B is selected when A0 is one.

The MAX5403/MAX5404/MAX5405 feature POR circuitry that sets the wiper to the midscale position at power-up.

### Applications Information

The MAX5403/MAX5404/MAX5405 are intended for a variety of circuits where accurate, fine-tuning adjustable resistance is required, such as in adjustable voltage or adjustable gain circuit configurations. It is primarily used in either a potentiometer divider or a variable resistor configuration.

#### Adjustable Current to Voltage Converter

Figure 5 shows the MAX5403/MAX5404/MAX5405 being used with a MAX4250 low-noise op amp to fine tune a current to voltage converter. Pins  $H_B$  and  $W_B$  of the MAX5403/MAX5404/MAX5405 3-terminal potentiometer (only pin  $W_A$  of the 2-terminal variable resistor) are connected to the node between  $R_3$  and  $R_2$  (pin  $L_X$  is connected to ground). Circuit space is minimized due to both devices' packaging.

#### Adjustable Gain Amplifier

Figure 6 shows how to use the MAX5403/MAX5404/MAX5405 to digitally adjust the gain of a noninverting op amp configuration. In Figure 6a, connect the MAX5403/MAX5404/MAX5405 as a 2-terminal variable resistor in series with a resistor to ground to form the adjustable gain control of a noninverting amplifier.

Similarly, Figure 6b shows how to use the MAX5403/MAX5404/MAX5405 as a 3-terminal potentiometer. In this application the MAX5403/MAX5404/MAX5405 low 5ppm/ $^{\circ}C$  ratiometric tempco allows for a very stable adjustable gain-configuration overtemperature.

Figure 4. Serial Data Format

Figure 5. I to V Converter

Figure 6a. Adjustable Gain Circuit Using: 2-Terminal Variable Resistor

Figure 6b. Adjustable Gain Circuit Using: 3-Terminal Potentiometer

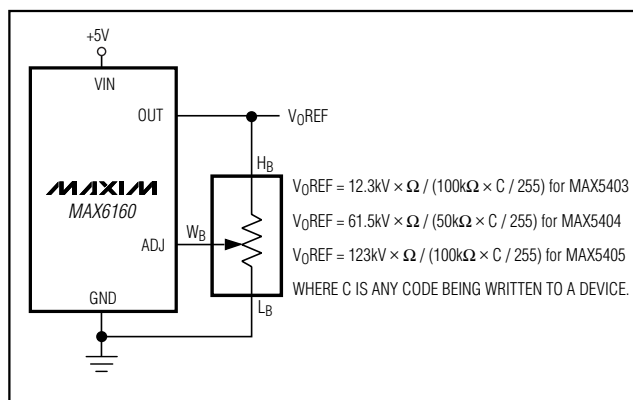

Figure 7a. Adjustable Voltage Reference Using: 3-Terminal Potentiometer

## Adjustable Voltage Reference

In Figure 7a, the MAX5403/MAX5404/MAX5405 is shown with the MAX6160 to make an adjustable voltage reference. In this circuit, the Hx pin of the MAX5403/MAX5404/MAX5405 is connected to the OUT pin of the MAX6160, the Lx pin of the MAX5403/MAX5404/MAX5405 is connected to GND, and the Wx

pin of the MAX5403/MAX5404/MAX5405 is connected to the ADJ pin of the MAX6160. The MAX5403/MAX5404/MAX5405 allow precise setting of the voltage reference output. A low 5ppm/°C ratiometric tempco allows a very stable, adjustable voltage over temperature.
