

**LC72122V**

## PLL Frequency Synthesizer for Portable Equipment Electronic Tuning

### Overview

The LC72122V is a low-voltage (1.8 to 3.6 V) PLL frequency synthesizer IC that allows portable TV (VHF)/FM/AM tuners to be constructed easily.

### Features

- High-speed programmable frequency divider
  - FMIN: 10 to 250 MHz ..Pulse swallower (divide-by-two prescaler built in)
  - AMIN: 2 to 40 MHz .....Pulse swallower 0.5 to 10 MHz ...Direct division
- IF counter
  - IFIN: 0.4 to 12 MHz .....For use as an AM/FM IF counter
- Reference frequency
  - Selectable from one of nine frequencies (crystal oscillator: 75 kHz)  
1, 2.5, 3, 5, 3.125, 6.25, 12.5, 15, and 25 kHz
- Phase comparator
  - Supports dead zone control
  - Built-in unlock detection circuit
  - Built-in deadlock clear circuit
  - Sub-charge pump for fast frequency locking
- Built-in MOS transistor for forming an active low-pass filter
- I/O ports
  - Dedicated output ports: 3
  - I/O ports: 2
  - Supports clock time base output
- Serial Data I/O
  - Supports CCB format communication with the system controller.
- Operating ranges
  - Supply voltage: 1.8 to 3.6 V
  - Operating temperature: -20 to +70°C
- Package
  - SSOP20

### Package Dimensions

unit: mm

**3179A-SSOP20**

- CCB is a trademark of SANYO ELECTRIC CO., LTD.
- CCB is SANYO's original bus format and all the bus addresses are controlled by SANYO.

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

## LC72122V

### Specifications

**Absolute Maximum Ratings at Ta = 25°C, V<sub>SSd</sub> = V<sub>SSa</sub> = 0 V**

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V <sub>DD</sub> max	V <sub>DD</sub>	-0.3 to +4.0	V
Maximum input voltage	V <sub>IN1</sub> max	CE, CL, DI	-0.3 to +7.0	V
	V <sub>IN2</sub> max	XIN, FMIN, AMIN, IFIN, AIN	-0.3 to V <sub>DD</sub> + 0.3	V
	V <sub>IN3</sub> max	IO1, IO2	-0.3 to +8	V
Maximum output voltage	V <sub>O1</sub> max	DO	-0.3 to +7.0	V
	V <sub>O2</sub> max	XOUT, PD	-0.3 to V <sub>DD</sub> + 0.3	V
	V <sub>O3</sub> max	BO1 to BO3, AOUT	-0.3 to +15	V
	V <sub>O4</sub> max	IO1, IO2	-0.3 to +8	V
Maximum output current	I <sub>O</sub> max	BO1 to BO3, IO1, IO2, DO, AOUT	0 to 6.0	mA
Allowable power dissipation	Pd max	Ta ≤ 70°C: SSOP20	150	mW
Operating temperature	Topr		-20 to +70	°C
Storage temperature	Tstg		-40 to +125	°C

**Allowable Operating Ranges at Ta = -20 to +70°C, V<sub>SSd</sub> = V<sub>SSa</sub> = 0 V**

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Supply voltage	V <sub>DD</sub>	V <sub>DD</sub>	1.8	2.2	3.6	V
Input high-level voltage	V <sub>IH1</sub>	CE, CL, DI	0.7 V <sub>DD</sub>		6.5	V
	V <sub>IH2</sub>	IO1, IO2	0.7 V <sub>DD</sub>		7	V
Input low-level voltage	V <sub>IL</sub>	CE, CL, DI, IO1, IO2	0		0.3 V <sub>DD</sub>	V
Output voltage	V <sub>O1</sub>	DO	0		6.5	V
	V <sub>O2</sub>	BO1 to BO3, AOUT	0		13	V
	V <sub>O3</sub>	IO1, IO2	0		7	V
Input frequency	f <sub>IN1</sub>	XIN: V <sub>IN1</sub>		75		kHz
	f <sub>IN2</sub>	FMIN: V <sub>IN2</sub>	10		250	MHz
	f <sub>IN3</sub>	AMIN: V <sub>IN3</sub> , SNS = 1	2		40	MHz
	f <sub>IN4</sub>	AMIN: V <sub>IN4</sub> , SNS = 0	0.5		10	MHz
	f <sub>IN5</sub>	IFIN: V <sub>IN5</sub>	0.4		12	MHz
Input amplitude	V <sub>IN1</sub>	XIN: f <sub>IN1</sub>	200		600	mVrms
	V <sub>IN2-1</sub>	FMIN: f = 10 to 50 MHz	50		600	mVrms
	V <sub>IN2-2</sub>	FMIN: f = 50 to 250 MHz	40		600	mVrms
	V <sub>IN3</sub>	AMIN: f <sub>IN3</sub> , SNS = 1	30		600	mVrms
	V <sub>IN4</sub>	AMIN: f <sub>IN4</sub> , SNS = 0	30		600	mVrms
	V <sub>IN5-1</sub>	IFIN: f <sub>IN5</sub> , IFS = 1	30		600	mVrms
	V <sub>IN5-2</sub>	IFIN: f <sub>IN5</sub> , IFS = 0	70		600	mVrms
Guaranteed crystal oscillator frequency	Xtal	XIN, XOUT *		75		kHz

\* Note : Recommended crystal oscillator CI value : CI ≤ 35 kΩ (for a 75kHz crystal )

The circuit constants for the crystal oscillator circuit depend on the crystal used, the printed circuit board pattern, and other items. Therefore we recommend consulting with the manufacturer of the crystal for evaluation and reliability.

The extremely high input impedance of the XIN pins means that applications must take the possibility of leakage into account.

## LC72122V

### Serial Data I/O Procedures

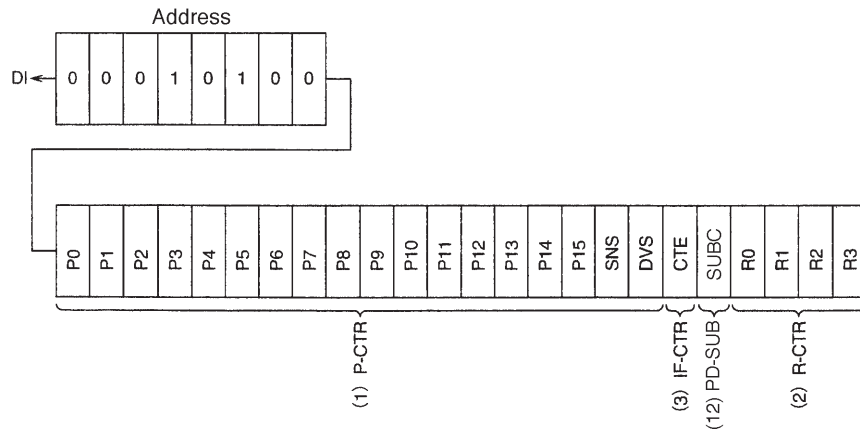

The LC72122V inputs and outputs data using the Sanyo CCB (computer control bus) audio IC serial bus format. This IC adopts an 8-bit address format CCB.

	I/O mode	Address								Function

## LC72122V

### Serial Data Input (IN1/IN2) $t_{SU}, t_{HD}, t_{EL}, t_{ES}, t_{EH} \geq 0.75 \mu s, t_{LC} < 0.75 \mu s$

1. CL: Normal high

2. CL: Normal low

### Serial Data Output (OUT) $t_{SU}, t_{HD}, t_{EL}, t_{ES}, t_{EH} \geq 0.75 \mu s, t_{DC}, t_{DH} < 0.35 \mu s$

1. CL: Normal high

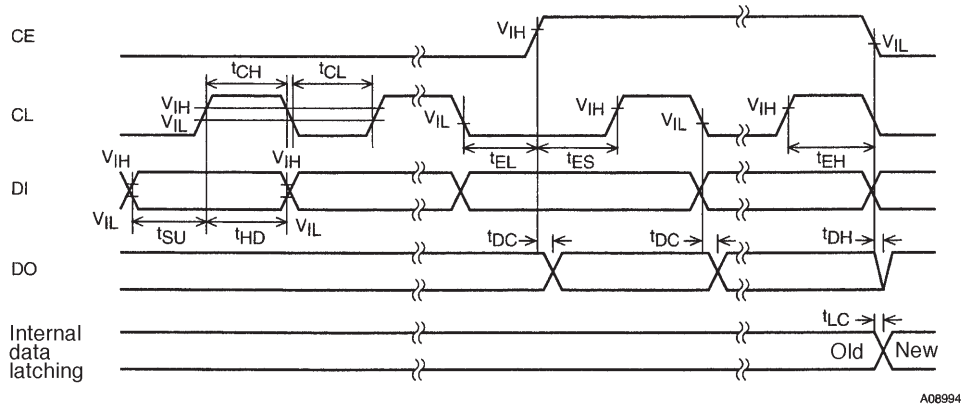

2. CL: Normal low

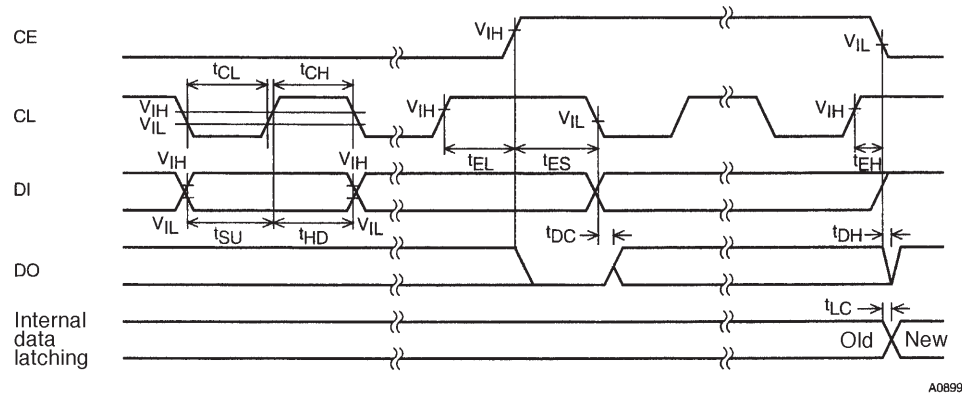

Note: Since the DO pin is an n-channel open drain circuit, the times for the data to change ( $t_{DC}$  and  $t_{DH}$ ) will differ depending on the value of the pull-up resistor, printed circuit board capacitance.

Serial Data Timing

A08994

CL Stopped at the Low Level

A08995

CL Stopped at the High Level

Parameter	Symbol	Pins	Conditions	min	typ	max	Unit
Data setup time	t <sub>SU</sub>	DI, CL		0.75			μs
Data hold time	t <sub>HD</sub>	DI, CL		0.75			μs

# LC72122V

## IF Counter Structure

The LC72122V IF counter is a 20-bit binary counter, and takes the IF signal from the IFIN pin as its input. The result of the count can be read out serially, MSB first, from the DO pin.

GT1	GT0	Measurement time	
		Measurement period (GT) (ms)	Wait time (t <sub>WU</sub> ) (ms)
0	0	8	3 to 4
0	1	16	3 to 4
1	0	32	7 to 8
1	1	64	7 to 8

The IF frequency (Fc) is measured by determining how many pulses were input to the IF counter in the stipulated measurement time, GT.

$$F_c = \frac{C}{GT} \quad (C = F_c \times GT) \quad C: \text{count value (number of pulses)}$$

## Sample IF Counter Frequency Calculations

- For a measurement time (GT) of 32 ms and a count value (C) of 53980 (hexadecimal), which is 342,400 (decimal) IF frequency (Fc) = 342,400 ÷ 32 ms = 10.7 MHz

A09001

- For a measurement time (GT) of 8 ms and a count value (C) of E10 (hexadecimal), which is 3600 (decimal) IF frequency (Fc) = 3600 ÷ 8 ms = 450 kHz

A09002

**IF Counter Operation**

A02623

Before starting the IF count, the IF counter must be reset in advance by setting CTE in the serial data to 0. The IF count is started by changing the CTE bit in the serial data from 0 to 1. The serial data is latched by the LC72122V when the CE pin is dropped from high to low. The IF signal must be supplied to the IFIN pin in the period between the point the CE pin goes low and the end of the wait time at the latest. Next, the value of the IF count at the end of the measurement period must be read out during the period CTE is 1. This is because the IF counter is reset when CTE is set to 0.

Note: When operating the IF counter, the control microcontroller must first check the state of the IF-IC SD (station detect) signal and only after determining that the SD signal is present turn on IF buffer output and execute an IF count operation. Auto-search techniques that use only the IF counter are not recommended, since it is possible for IF buffer leakage output to cause incorrect stops at points where there is no station.

If the auto-search technique is implemented using only the IF counter in combination with an IF-IC without SD output, sensitivity-degradation mode ( IFS = 0 ) should be selected.

**IFIN Minimum Sensitivity Ratings**

IFS	f(MHz)		
	0.4 ≤ f < 0.5	0.5 ≤ f < 8	8 ≤ f ≤ 12
1: Normal mode	30mVrms (0.1 to 3mVrms)	30mVrms	30mVrms (1 to 10mVrms)
0: Degradation mode	70mVrms (5 to 15mVrms)	70mVrms	70mVrms (20 to 40mVrms)

Note: Values in parentheses are actual performance values presented as reference data.

**Unlock Detection Timing**

1. Unlock Detection Determination Timing

Unlock detection is performed in the reference frequency ( $f_{ref}$ ) period (interval). Therefore, in principle, unlock determination requires a time longer than the period of the reference frequency. However, immediately after changing the divisor N (frequency) unlock detection must be performed after waiting at least two periods of the reference frequency.

A09004

**Figure 1 Unlock Detection Timing**

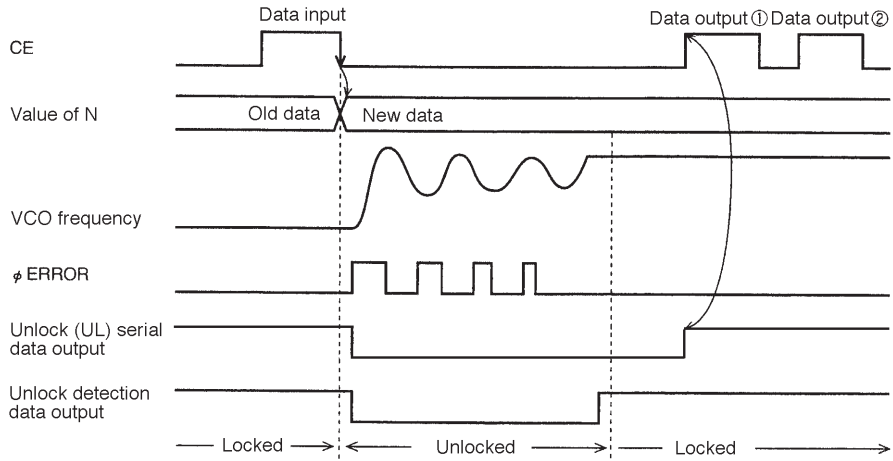

For example, if  $f_{ref}$  is 1 kHz (and thus the period is 1 ms), after changing the divisor N, the system must wait at least 2 ms before checking for the unlocked state.

A09005

**Figure 2 Circuit Structure**

2. Unlock Detection Software

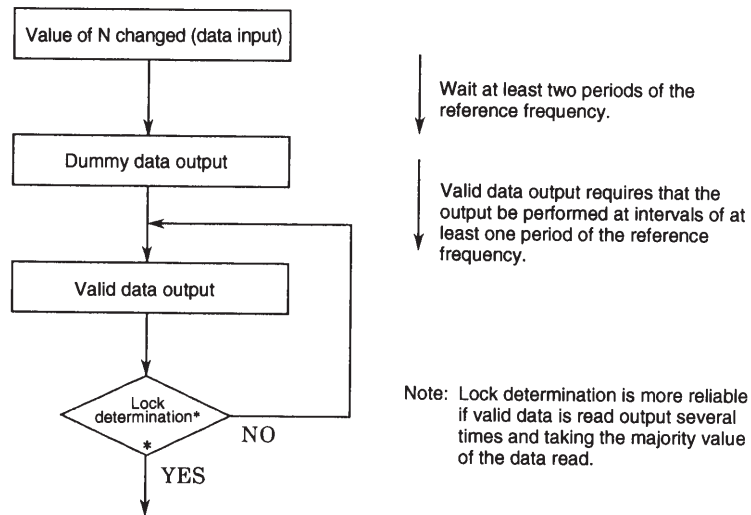

A09006

Figure 3

3. When Outputting Unlock Data Using Serial Data Output:

Once the LC72122V detects an unlocked state, it does not reset the unlock data (UL) until the next data output (or data input) operation is performed. At the data output ① point in Figure 3, although the VCO frequency is stable (locked), the unlock data remains set to the unlocked state since no data output has been performed since the value of N was changed. Thus, even though the frequency became stable (locked), from the point of view of the data, the circuit is in the unlocked state. Therefore, the data output ① immediately following a change to the value of N should be seen as a dummy data, and the data from the second data output (data output ②) and later outputs should be seen as valid data.

Lock Determination Flowchart

**When directly outputting data from the DO pin (set up by the DO pin control data)**

Since the DO pin outputs the unlocked state (locked: high, unlocked: low) the timing considerations in the technique described in the previous section are not necessary. After changing the value of N, the locked state can be determined after waiting at least two periods of the reference frequency.

**Notes on Clock Time Base Usage**

When the clock time base output is used, the value of the pull-up resistor for the output pin ( $\overline{BO1}$ ) must be at least 100 k $\Omega$ . We recommend the use of a Schmitt input on the receiving controller (microprocessor) to prevent chattering. This is to avoid degradation of the VCO C/N characteristics when using the built-in low-pass filter transistor to form the loop filter. Since the clock time base output pin and the low-pass filter transistor ground are the same mode in the IC, the time base output pin current fluctuations must be suppressed to limit the influence on the low-pass filter.

**Other Items**

1. Notes on the Phase Comparator Dead Zone

DZ1	DZ0	Dead-zone mode	Charge pump	Dead zone
0	0	DZA	ON/ON	--0 s
0	1	DZB	ON/ON	-0 s
1	0	DZC	OFF/OFF	+0 s
1	1	DZD	OFF/OFF	+ +0 s

Since correction pulses are output from the charge pump even if the PLL is locked when the charge pump is in the ON/ON state, the loop can easily become unstable. This point requires special care when designing application circuits. Since the characteristics may change with the supply voltage, an optimal dead zone must be selected for the actual end product itself. The table shows the state when  $V_{DD}$  is 2.2 V (typical). As the supply voltage increases, the charge pump circuit tends to go to the ON/ON state.

The following problems may occur in the ON/ON state.

- Side band generation due to reference frequency leakage
- Side band generation due to both the correction pulse envelope and low frequency leakage

Schemes in which a dead zone is present (OFF/OFF) have good loop stability, but have the problem that acquiring a high C/N ratio can be difficult. On the other hand, although it is easy to acquire a high C/N ratio with schemes in which there is no dead zone, it is difficult to achieve high loop stability. Therefore, it can be effective to select DZA or DZB, which have no dead zone, in applications which require an FM S/N ratio in excess of 90 to 100 dB, or in which an increased AM stereo pilot margin is desired. On the other hand, we recommend selecting DZC or DZD, which provide a dead zone, for applications which do not require such a high FM signal-to-noise ratio and in which either AM stereo is not used or an adequate AM stereo pilot margin can be achieved.

#### Dead Zone

The phase comparator compares  $f_p$  to a reference frequency ( $f_r$ ) as shown in Figure 4. Although the characteristics of this circuit (see Figure 5) are such that the output voltage is proportional to the phase difference  $\phi$  (line A), a region (the dead zone) in which it is not possible to compare small phase differences occurs in actual ICs due to internal circuit delays and other factors (line B). A dead zone as small as possible is desirable for products that must provide a high S/N ratio.

However, since a larger dead zone makes this circuit easier to use, a larger dead zone is appropriate for popularly-priced products. This is because it is possible for RF signals to leak from the mixer to the VCO and modulate the VCO in popularly-priced products in the presence of strong RF inputs. When the dead zone is narrow, the circuit outputs correction pulses and this output can further modulate the VCO and generate beat frequencies with the RF signal.

Figure 4

Figure 5

#### 2. Notes on the FMIN, AMIN, and IFIN Pins

Coupling capacitors must be placed as close as possible to their respective pin. A capacitance of about 100 pF is desirable. In particular, if a capacitance of 1000 pF or over is used for the IF pin, the time to reach the bias level will increase and incorrect counting may occur due to the relationship with the wait time.

#### 3. Notes on IF Counting → SD must be used in conjunction with the IF counting time

When using IF counting, always implement IF counting by having the microprocessor determine the presence of the IF-IC SD (station detect) signal and turn on the IF counter buffer only if the SD signal is present. Schemes in which auto-searches are performed with only IF counting are not recommended, since they can stop at points where there is no signal due to leakage output from the IF counter buffer.

4. DO Pin Usage Techniques

In addition to data output mode times, the DO pin can also be used to check for IF counter count completion and for unlock detection output. Also, an input pin state can be output unchanged through the DO pin and input to the controller.

5. Power Supply Pins

A capacitor must be inserted between the power supply  $V_{DD}$  and  $V_{SS}$  pins for noise exclusion. This capacitor must be placed as close as possible to the  $V_{DD}$  and  $V_{SS}$  pins.

6. Note on VCO designing

VCO ( local oscillator ) must keep its oscillation even if the control voltage (  $V_{tune}$  ) goes to 0V. When there is a possibility of oscillation halt,  $V_{tune}$  must be forcibly set to  $V_{CC}$  temporarily to prevent the PLL from being deadlocked. ( Deadlock clear circuit )

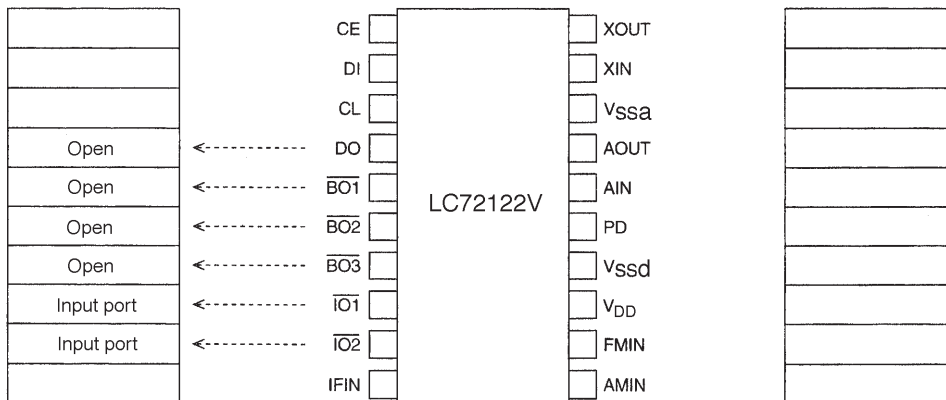

7. Structure of the sub-charge pump circuit provided for high-speed frequency locking

The fast locking sub-charge pump circuit (PDS) is controlled by the SUBC control signal. When the PDS circuit is operating, the effective resistance of R1 is reduced to about 250  $\Omega$ . This reduces the locking time.

Note that during normal reception, SUBC should be set to 0 to stop PDS circuit operation, and SUBC should be set to 1 to operate the PDS circuit when changing stations.

Pin States at a Power-On Reset

A09008

Note: Although the IC is initialized after power is first applied by the power on reset circuit, applications must also send a full set of data over the CCB bus immediately after power is first applied to assure safe and stable operation.

Sample Application System

- Specifications of any and all SANYO products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Electric Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
