- Notes:
1. A start-up delay of 200 μ s is required after power-up, followed by a minimum of eight initialization cycles (/RAS only refresh or /CAS before /RAS refresh) before proper device operation is achieved.
 2. The AC characteristics assumes $t_T = 2\text{ns}$.
 3. $V_{IH}(\text{Min.})$ and $V_{IL}(\text{Max.})$ are reference levels for measuring input timing signals. Transition time (t_T) are measured between V_{IH} and V_{IL} .
 4. This parameter is measured with a load circuit equivalent to 2TTL loads and 100pF.
 5. Operation within the $t_{RCD}(\text{Max.})$ limit ensures that $t_{RAC}(\text{Max.})$ can be met. $t_{RCD}(\text{Max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{Max.})$ limit, then the access time is controlled by t_{CAC} .
 6. Operation within the $t_{RAD}(\text{Max.})$ limit ensures that $t_{RAC}(\text{Max.})$ can be met. $t_{RAD}(\text{Max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{Max.})$ limit, then the access time is controlled by t_{AA} .
 7. $t_{CEZ}(\text{Max.})$, $t_{REZ}(\text{Max.})$ and $t_{WEZ}(\text{Max.})$ define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
 8. t_{CEZ} and t_{REZ} must be satisfied for open circuit condition.
 9. t_{RCH} or t_{RRH} must be satisfied for a read cycle.
