# 4K/8K x 18
# Synchronous Dual-Port Static RAM

## Features

- **True dual-ported memory cells which allow simultaneous access of the same memory location**
- **Two Flow-Through/Pipelined devices**
  - **4K x 18 organization (CY7C09349A)**
  - **8K x 18 organization (CY7C09359A)**
- **Three Modes**
  - **Flow-Through**
  - **Pipelined**
  - **Burst**
- **Pipelined output mode on both ports allows fast 100-MHz cycle time**
- **0.35-micron CMOS for optimum speed/power**

- **High-speed clock to data access 6.5[1]/7.5/9/12 ns (max.)**
- **Low operating power**
  - **Active = 200 mA (typical)**
  - **Standby = 0.05 mA (typical)**
- **Fully synchronous interface for easier operation**
- **Burst counters increment addresses internally**
  - **Shorten cycle times**
  - **Minimize bus noise**
  - **Supported in Flow-Through and Pipelined modes**
- **Dual Chip enables for easy depth expansion**
- **Upper and lower byte controls for bus matching**
- **Automatic power-down**
- **Commercial and Industrial temperature ranges**
- **Available in 100-pin TQFP**

## Functional Description

The CY7C09349A and CY7C09359A are high-speed synchronous CMOS 4K and 8K x 18 dual-port static RAMs. Two ports are provided, permitting independent, simultaneous access for reads and writes to any location in memory.[3] Registers on control, address, and data lines allow for minimal set-up and hold times. In pipelined output mode, data is registered for decreased cycle time. Clock to data valid $t_{CD2}$ = 6.5 ns[1] (pipelined). Flow-through mode can also be used to bypass the pipelined output register to eliminate access latency. In flow-through mode data will be available $t_{CD1}$ = 15 ns after the address is clocked into the device. Pipelined output or flow-through mode is selected via the $\overline{FT}$/Pipe pin.

Each port contains a burst counter on the input address register. The internal write pulse width is independent of the LOW-to-HIGH transition of the clock signal. The internal write pulse is self-timed to allow the shortest possible cycle times.
A HIGH on $\overline{CE}_0$ or LOW on $CE_1$ for one clock cycle will power down the internal circuitry to reduce the static power consumption. The use of multiple Chip Enables allows easier banking of multiple chips for depth expansion configurations. In the pipelined mode, one cycle is required with $\overline{CE}_0$ LOW and $CE_1$ HIGH to reactivate the outputs.

Counter enable inputs are provided to stall the operation of the address input and utilize the internal address generated by the internal counter for fast interleaved memory applications. A port's burst counter is loaded with the port's Address Strobe ($\overline{ADS}$). When the port's Count Enable ($\overline{CNTEN}$) is asserted, the address counter will increment on each LOW-to-HIGH transition of that port's clock signal. This will read/write one word from/into each successive address location until $\overline{CNTEN}$ is deasserted. The counter can address the entire memory array and will loop back to the start. Counter Reset ($\overline{CNTRST}$) is used to reset the burst counter.

All parts are available in 100-pin Thin Quad Plastic Flatpack (TQFP) packages.

**Note:**
3. When simultaneously writing to the same location, final value cannot be determined.

## Pin Definitions

| Left Port | Right Port | Description |
|---|---|---|
| $A_{0L}$–$A_{12L}$ | $A_{0R}$–$A_{12R}$ | Address Inputs ($A_0$–$A_{11}$ for 4K, $A_0$–$A_{12}$ for 8K devices). |
| $\overline{ADS}_L$ | $\overline{ADS}_R$ | Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW during normal read or write transactions. Asserting this signal LOW also loads the burst address counter with data present on the I/O pins. |
| $\overline{CE}_{0L}$,$CE_{1L}$ | $\overline{CE}_{0R}$,$CE_{1R}$ | Chip Enable Input. To select either the left or right port, both $\overline{CE}_0$ AND $CE_1$ must be asserted to their active states ($\overline{CE}_0 \leq V_{IL}$ and $CE_1 \geq V_{IH}$). |
| $CLK_L$ | $CLK_R$ | Clock Signal. This input can be free running or strobed. Maximum clock input rate is $f_{MAX}$. |
| $\overline{CNTEN}_L$ | $\overline{CNTEN}_R$ | Counter Enable Input. Asserting this signal LOW increments the burst address counter of its respective port on each rising edge of CLK. $\overline{CNTEN}$ is disabled if $\overline{ADS}$ or $\overline{CNTRST}$ are asserted LOW. |
| $\overline{CNTRST}_L$ | $\overline{CNTRST}_R$ | Counter Reset Input. Asserting this signal LOW resets the burst address counter of its respective port to zero. $\overline{CNTRST}$ is not disabled by asserting $\overline{ADS}$ or $\overline{CNTEN}$. |
| $I/O_{0L}$–$I/O_{17L}$ | $I/O_{0R}$–$I/O_{17R}$ | Data Bus Input/Output ($I/O_0$–$I/O_{15}$ for x16 devices). |
| $\overline{LB}_L$ | $\overline{LB}_R$ | Lower Byte Select Input. Asserting this signal LOW enables read and write operations to the lower byte ($I/O_0$–$I/O_8$ for x18, $I/O_0$–$I/O_7$ for x16) of the memory array. For read operations both the $\overline{LB}$ and $\overline{OE}$ signals must be asserted to drive output data on the lower byte of the data pins. |
| $\overline{UB}_L$ | $\overline{UB}_R$ | Upper Byte Select Input. Same function as $\overline{LB}$, but to the upper byte ($I/O_{8/9L}$–$I/O_{15/17L}$). |
| $\overline{OE}_L$ | $\overline{OE}_R$ | Output Enable Input. This signal must be asserted LOW to enable the I/O data pins during read operations. |
| $R/\overline{W}_L$ | $R/\overline{W}_R$ | Read/Write Enable Input. This signal is asserted LOW to write to the dual port memory array. For read operations, assert this pin HIGH. |
| $\overline{FT}/PIPE_L$ | $\overline{FT}/PIPE_R$ | Flow-Through/Pipelined Select Input. For flow-through mode operation, assert this pin LOW. For pipelined mode operation, assert this pin HIGH. |
| GND | | Ground Input. |
| NC | | No Connect. |
| $V_{CC}$ | | Power Input. |

## Switching Waveforms

### Read Cycle for Flow-Through Output ($\overline{FT}/PIPE = V_{IL}$)[9, 10, 11, 12]

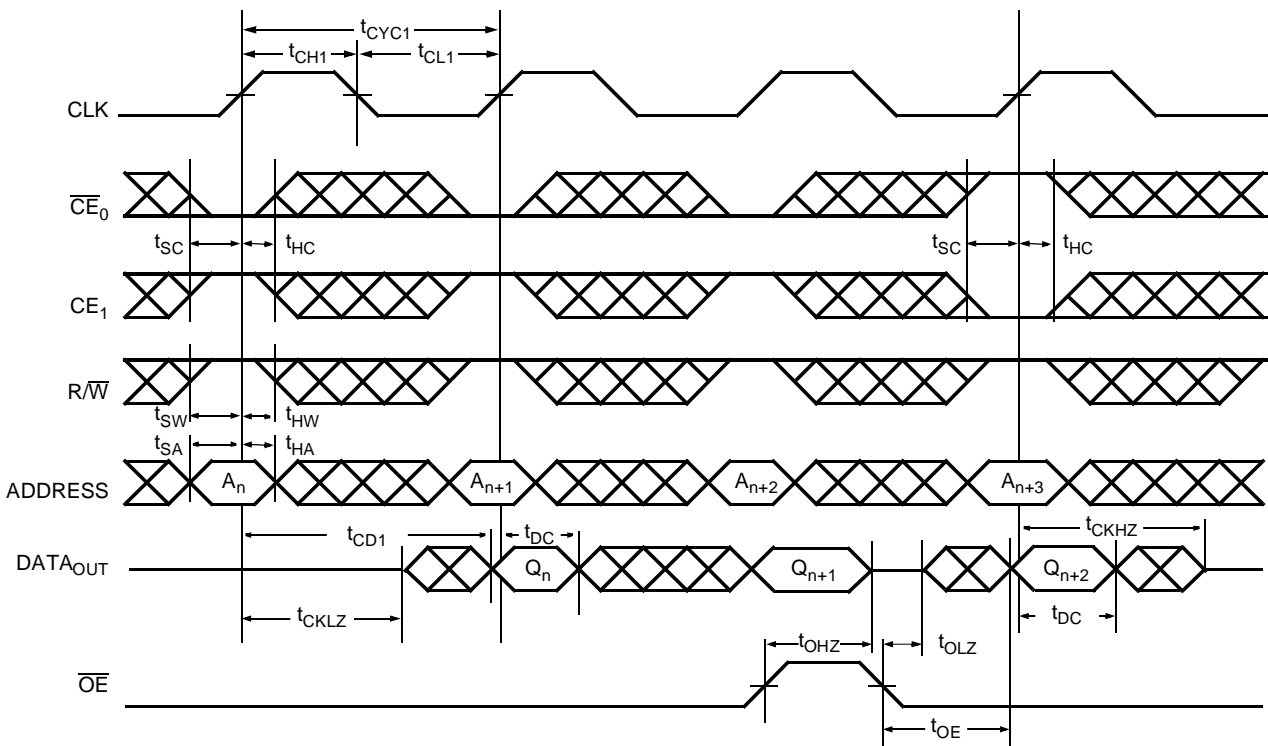

### Read Cycle for Pipelined Operation ($\overline{FT}/PIPE = V_{IH}$)[9, 10, 11, 12]

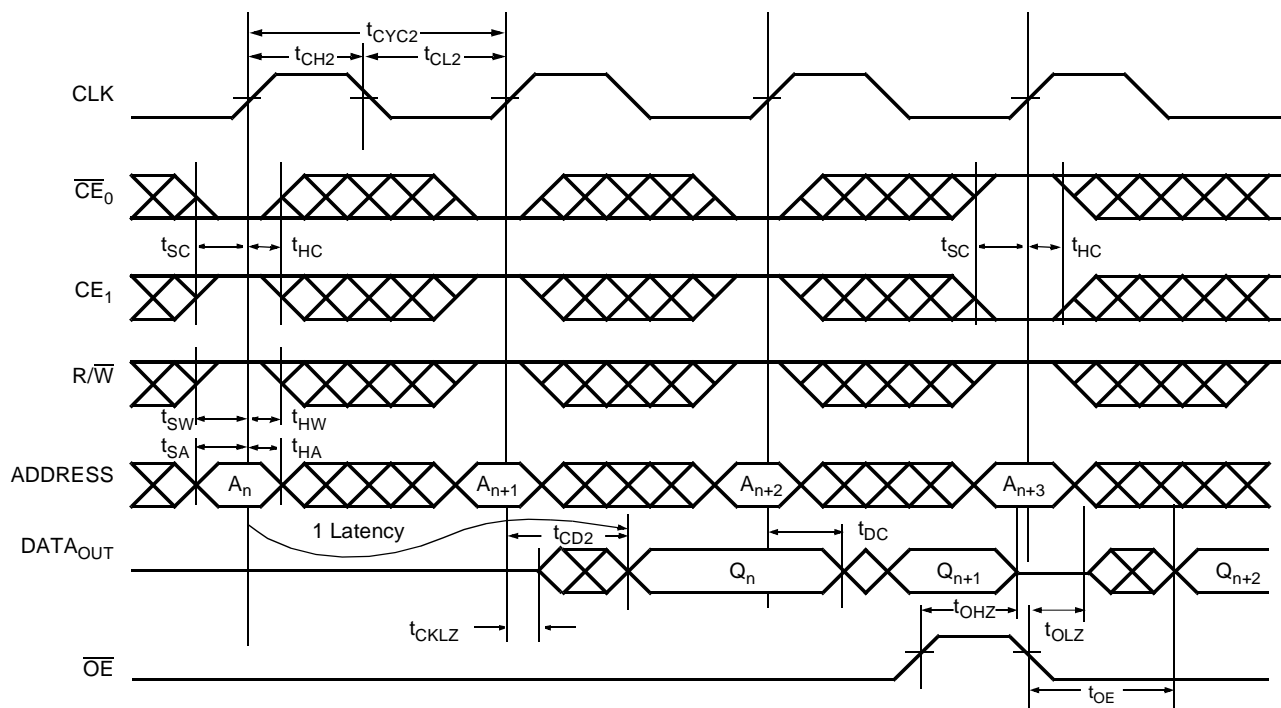

**Notes:**
9. $\overline{OE}$ is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
10. $\overline{ADS} = V_{IL}$, $\overline{CNTEN}$ and $\overline{CNTRST} = V_{IH}$.
11. The output is disabled (high-impedance state) by $\overline{CE}_0 = V_{IH}$ or $CE_1 = V_{IL}$ following the next rising edge of the clock.
12. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.

## Switching Waveforms (continued)

**Bank Select Pipelined Read**[13, 14]

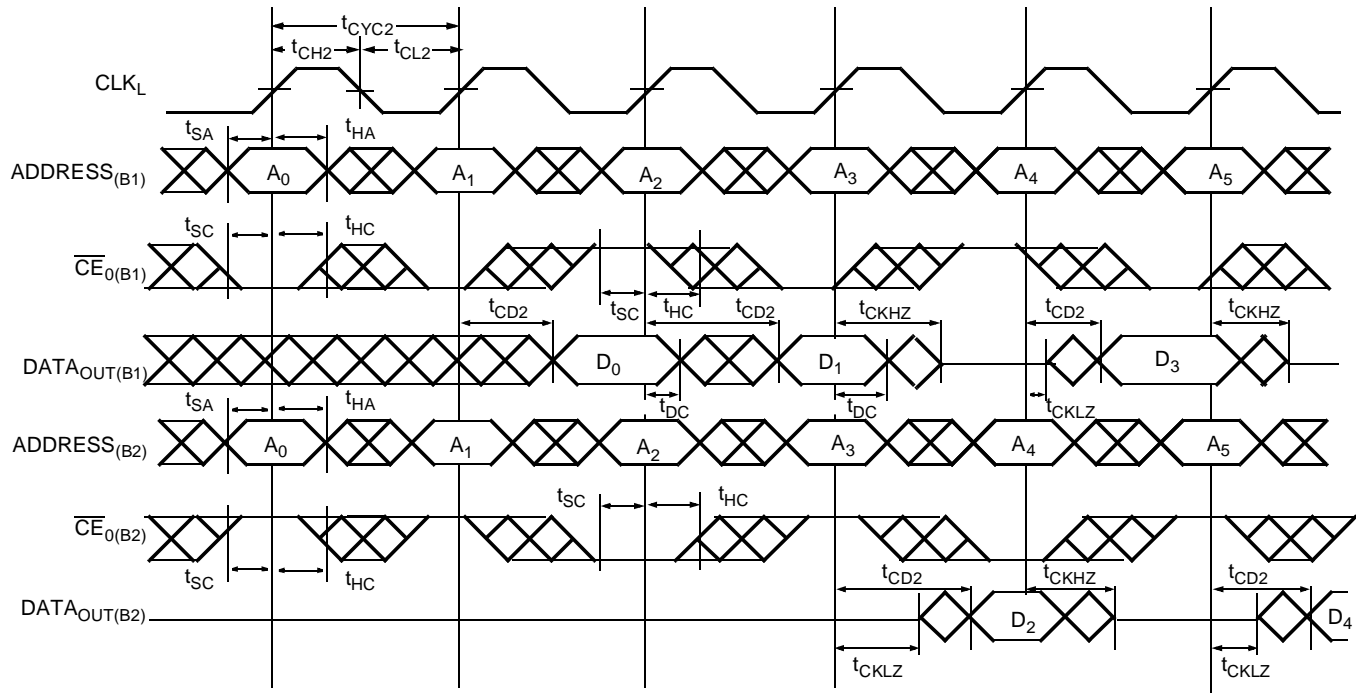

**Left Port Write to Flow-Through Right Port Read**[15, 16, 17, 18]

**Notes:**

13. In this depth expansion example, B1 represents Bank #1 and B2 is Bank #2; Each Bank consists of one Cypress dual-port device from this data sheet. ADDRESS$_{(B1)}$ = ADDRESS$_{(B2)}$.
14. $\overline{UB}$, $\overline{LB}$, $\overline{OE}$ and $\overline{ADS}$ = $V_{IL}$; CE$_{1(B1)}$, CE$_{1(B2)}$, R/$\overline{W}$, $\overline{CNTEN}$, and $\overline{CNTRST}$ = $V_{IH}$.
15. The same waveforms apply for a right port write to flow-through left port read.
16. $\overline{CE_0}$, $\overline{UB}$, $\overline{LB}$, and $\overline{ADS}$ = $V_{IL}$; CE$_1$, $\overline{CNTEN}$, and $\overline{CNTRST}$ = $V_{IH}$.
17. $\overline{OE}$ = $V_{IL}$ for the right port, which is being read from. $\overline{OE}$ = $V_{IH}$ for the left port, which is being written to.
18. It t$_{CCS}$ ≤ maximum specified, then data from right port READ is not valid until the maximum specified for t$_{CWDD}$. If t$_{CCS}$>maximum specified, then data is not valid until t$_{CCS}$ + t$_{CD1}$. t$_{CWDD}$ does not apply in this case.

**Notes:**
19. Output state (HIGH, LOW, or High-Impedance) is determined by the previous cycle control signals.
20. $\overline{CE}_0$ and $\overline{ADS} = V_{IL}$; $CE_1$, CNTEN, and $\overline{CNTRST} = V_{IH}$.
