

SPANSION™ Flash Memory

Data Sheet

September 2003

This document specifies SPANSION™ memory products that are now offered by both Advanced Micro Devices and Fujitsu. Although the document is marked with the name of the company that originally developed the specification, these products will be offered to customers of both AMD and Fujitsu.

Continuity of Specifications

There is no change to this datasheet as a result of offering the device as a SPANSION™ product. Future routine revisions will occur when appropriate, and changes will be noted in a revision summary.

Continuity of Ordering Part Numbers

AMD and Fujitsu continue to support existing part numbers beginning with "Am" and "MBM". To order these products, please use only the Ordering Part Numbers listed in this document.

For More Information

Please contact your local AMD or Fujitsu sales office for additional information about SPANSION™ memory solutions.

PAGE MODE FLASH MEMORY

CMOS

32 M (2 M × 16/1 M × 32) BIT**MBM29PL3200TE_{70/90}****MBM29PL3200BE_{70/90}**

DESCRIPTION

MBM29PL3200TE/BE is 32 M-bit, 3.0 V-only Page mode Flash memory organized as 2 M words of 16 bits each or 1 M words of 32 bits each. The device is offered in 90-pin SSOP and 84-ball FBGA packages. This device is designed to be programmed in-system with the standard system 3.0 V V_{CC} supply. 12.0 V V_{PP} and 5.0 V V_{CC} are not required for write or erase operations. The device can also be reprogrammed in standard EPROM programmers.

PRODUCT LINE-UP

Part No.		MBM29PL3200TE70 MBM29PL3200BE70	MBM29PL3200TE90 MBM29PL3200BE90
Ambient Temperature		-40 °C to +85 °C	
Access Time (Max)	Random	70 ns	90 ns
	Page	25 ns	35 ns
Power Supply Voltage		3.3 V ^{+0.3V} _{-0.3V}	3.0 V ^{+0.6V} _{-0.3V}
Power Consumption (Max)	In Operating	288 mW	
	Erase/Program	288 mW	
	CMOS Standby	0.018 mW	

PACKAGES

90-pin plastic SSOP	84-ball plastic FBGA
	
(FPT-90P-M01)	(BGA-84P-M01)

(Continued)

The device provides truly high performance non-volatile Flash memory solution. The device offers fast page access times of 25 ns and 35 ns with random access times of 70 ns and 90 ns, allowing operation of high-speed microprocessors without wait states. To eliminate bus contention, the device has separate chip enable (\overline{CE}), write enable (\overline{WE}) and output enable (\overline{OE}) controls. The page size is 8 words or 4 double words.

The device is command set compatible with JEDEC standard E²PROMs. Commands are written to the command register using standard microprocessor write timings. Register contents serve as input to an internal state-machine which controls the erase and programming circuitry. Write cycles also internally latch addresses and data needed for the programming and erase operations. Reading data out of the device is similar to reading from 5.0 V and 12.0 V Flash or EPROM devices.

The device is programmed by executing the program command sequence. This will invoke the Embedded Program™ * Algorithm, which is an internal algorithm that automatically times the program pulse widths and verifies proper cell margins. Typically, each sector can be programmed and verified in about 1.3 seconds. Erase is accomplished by executing the erase command sequence. This will invoke the Embedded Erase™ * Algorithm, which is an internal algorithm that automatically preprograms the array if it is not already programmed before executing the erase operation. During erase, the device automatically times the erase pulse widths and verifies proper cell margins.

Any individual sector is typically erased and verified in 4 seconds (if already preprogrammed.)

The device also features a sector erase architecture. The sector mode allows each sector to be erased and reprogrammed without affecting other sectors. The device is erased when shipped from the factory.

The device features single 3.0 V power supply operation for both read and write functions. Internally generated and regulated voltages are provided for the program and erase operations. A low V_{CC} detector automatically inhibits write operations on the loss of power. The end of program or erase is detected by \overline{Data} Polling of DQ₇, by the Toggle Bit feature on DQ₆, output pin. Once the end of a program or erase cycle has been completed, the device internally resets to the read mode.

Fujitsu's Flash technology combines years of Flash memory manufacturing experience to produce the highest levels of quality, reliability, and cost effectiveness. The device memory electrically erases all bits within a sector simultaneously via Fowler-Nordhiem tunneling. The words/double words are programmed one word/double word at a time using the EPROM programming mechanism of hot electron injection.

■ FEATURES

- **0.23 μ m Process Technology**
- **Single 3.0 V read, program and erase**
Minimized system level power requirements
- **High Performance Page Mode**
25 ns maximum page access time (70 ns random access time)
- **8 words Page ($\times 16$) / 4 double words Page ($\times 32$) size**
- **Compatible with JEDEC-standard commands**
Uses same software commands as E²PROMs
- **Compatible with JEDEC-standard world-wide pinouts**
90-pin SSOP (Package suffix : PFV)
84-ball FBGA (Package suffix : PBT)
- **Minimum 100,000 program/erase cycles**
- **Sector erase architecture**
One 16 K word, two 8 K words, one 96 K word, and fifteen 128 K words sectors in word mode ($\times 16$)
One 8 K double word, two 4 K double words, one 48 K double word, and fifteen 64 K double words sectors in double word mode ($\times 32$)
Any combination of sectors can be concurrently erased. The devices also support full chip erase.
- **Boot Code Sector Architecture**
T = Top sector
B = Bottom sector
- **Embedded Erase™ Algorithms**
Automatically pre-programs and erases the chip or any sector
- **Embedded Program™ Algorithms**
Automatically programs and verifies data at specified address
- **Data Polling and Toggle Bit feature for detection of program or erase cycle completion**
- **Automatic sleep mode**
When addresses remain stable, automatically switches themselves to low power mode
- **Low V_{cc} write inhibit ≤ 2.5 V**
- **Erase Suspend/Resume**
Suspends the erase operation to allow a read data and/or program in another sector within the same device
- **Sector protection**
Hardware method disables any combination of sectors from program or erase operations
- **Fast Programming Function by Extended command**
- **Temporary sector unprotection**
Temporary sector unprotection with the software command
- **In accordance with CFI (Common Flash Memory Interface)**

MBM29PL3200TE_{70/90}/MBM29PL3200BE_{70/90}

DW : Double Word

W : Word

- *1: Both of these reset commands are equivalent.
- *2: This command is valid during Fast Mode.
- *3: The valid addresses are A₆ to A₀.
- *4: This command is valid while HiddenROM mode.
- *5: The data "00h" is also acceptable.
- *6: The fourth bus cycle is only for read.

Notes : • Address bits A₁₉ to A₁₁ = X = “H” or “L” for all address commands except Program Address (PA), and Sector Address (SA).

- [illegible]

The system should generate the following address patterns :

DW (Double Word) Mode : 555h or 2AAh to addresses A₁₀ to A₀

W (Word) Mode : AAAh or 555h to addresses A₁₀ to A₀, and A-1

- Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.
- The command combinations not described in MBM29PL3200TE/BE Command Definitions Table are illegal.

■ FUNCTIONAL DESCRIPTION

Read Mode

The device has two control functions which must be satisfied in order to obtain data at the outputs. \overline{CE} is the power control and should be used for device selection. \overline{OE} is the output control and should be used to gate data to the output pins when a device is selected.

Address access time (t_{ACC}) is equal to the delay from stable addresses to valid output data. The chip enable access time (t_{CE}) is the delay from stable addresses and stable \overline{CE} to valid data at the output pins. The output enable access time (t_{OE}) is the delay from the falling edge of \overline{OE} to valid data at the output pins (assuming the addresses have been stable prior to $t_{ACC} - t_{OE}$ time). When reading out data without changing addresses after power-up, it is necessary to input hardware reset or to change \overline{CE} pin from "H" to "L".

Page Mode Read

The device is capable of fast Page mode read and compatible with the Page mode Mask ROM read operation. This mode provides faster read access speed for random locations within a page. The Page size of the device is 8 words, or 4 double words, within the appropriate Page being selected by the higher address bits A_{19} to A_2 and the LSB bits A_1 , A_0 (in double word mode) and A_1 to A_{-1} (in word mode) determining the specific double word/word within that page. This is an asynchronous operation with the microprocessor supplying the specific double word or word location.

The random or initial page access is equal to t_{ACC} and subsequent Page read access (as long as the locations specified by the microprocessor fall within that Page) is equivalent to t_{PACC} . Here again, \overline{CE} selects the device and \overline{OE} is the output control and should be used to gate data to the output pins if the device is selected. Fast Page mode accesses are obtained by keeping A_{19} to A_2 constant and changing A_1 and A_0 to select the specific double word, or changing A_1 to A_{-1} to select the specific word within that page. See "Figure 5.2" for timing specifications.

Standby Mode

The device has CMOS standby mode (\overline{CE} input held at $V_{CC} \pm 0.3$ V.), when the current consumed is less than 50 μ A. In the standby mode, the output pins are in a high impedance state, independent of \overline{OE} input.

During Embedded Algorithm operation, V_{CC} Active current (I_{CC2}) is required even if $\overline{CE} = \text{"H"}$. The device can be read with standard access time (t_{CE}) from either of these standby modes.

In the standby mode, the output pins are in the high impedance state, independent of \overline{OE} input.

Automatic Sleep Mode

Automatic sleep mode lower consumption during read-out of the device data. This mode can be useful for applications such as a handy terminal that requires low power consumption.

To activate this mode, the device automatically switches itself to low power mode when addresses remain stable during access time of 150 ns. It is not necessary to control \overline{CE} , \overline{WE} and \overline{OE} in this mode. In this mode, the current consumed is typically 50 μ A (CMOS Level).

Since the data are latched during this mode, they are read out continuously. If the addresses are changed, this mode is canceled automatically, and the device reads the data for changed addresses.

Output Disable

With the \overline{OE} input is at a logic high level (V_{IH}), output from the device is disabled. This will put the output pins in a high impedance state.

Autoselect

The autoselect mode allows the reading out of a binary code from the device and will identify its manufacturer and type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional over the entire temperature range of the device.

To activate this mode, the programming equipment must force V_{ID} on address pin A_9 . Three identifier words may then be sequenced from the device outputs by toggling address A_0 and A_1 from V_{IL} to V_{IH} . All addresses are DON'T CAREs except A_6 , A_3 , A_2 , A_1 , and A_0 (A_{-1}). (See "MBM29PL3200TE/BE User Bus Operations Tables ($DW/\overline{W} = V_{IH}$ and $DW/\overline{W} = V_{IL}$)".)

The manufacturer and device codes may also be read via the command register, for instance when the device is erased or programmed in a system without access to high voltage on the A_9 pin. The command sequence is illustrated in "MBM29PL3200TE/BE Command Definitions" Table. (Refer to "■COMMAND DEFINITIONS Autoselect Command".)

A read cycle from address 00h returns the manufacturer's code (Fujitsu = 04h). A read cycle from address 01h, 0Eh to 0Fh returns the device code. (See "MBM29PL3200TE/BE Sector Protection Verify Autoselect Codes and Expanded Autoselect Code" Tables.)

In order to determine which sectors are write protected, A_1 must be at V_{IH} while running through the sector addresses; if the selected sector is protected, a logical '1' will be output on DQ_0 ($DQ_0 = 1$).

Write

The device erasure and programming are accomplished via the command register. The contents of the register serve as inputs to the internal state machine. The state machine outputs dictate the function of the device.

The command register itself does not occupy any addressable memory location. The register is a latch used to store the commands, along with the address and data information needed to execute the command. The command register is written by bringing \overline{WE} to V_{IL} , while \overline{CE} is at V_{IL} and \overline{OE} is at V_{IH} . Addresses are latched on the falling edge of \overline{WE} or \overline{CE} , whichever happens later, while data is latched on the rising edge of \overline{WE} or \overline{CE} , whichever happens first. Standard microprocessor write timings are used.

Refer to AC Write Characteristics and the Erase/Programming Waveforms for specific timing parameters.

Sector Protection

The device has hardware sector protection. This feature will disable both program and erase operations in any number of sectors (0 through 18). The sector protection feature is enabled using programming equipment at the user's site. The device is shipped with all sectors unprotected.

To activate this mode, the programming equipment must force V_{ID} on address pin A_9 and control pin \overline{OE} , $\overline{CE} = V_{IL}$, $A_6 = A_3 = A_2 = A_0 = V_{IL}$, $A_1 = V_{IH}$. The sector address pins (A_{19} , A_{18} , A_{17} , A_{16} , A_{15} , A_{14} , A_{13} , and A_{12}) should be set to the sector to be protected. Sector Address (MBM29PL3200TE/BE) Tables define the sector address for each of the nineteen (19) individual sectors. Programming of the protection circuitry begins on the falling edge of the \overline{WE} pulse and is terminated with the rising edge of the same. Sector addresses must be held constant during the \overline{WE} pulse. See "Figures 15 and 21" for sector protection waveforms and algorithms.

To verify programming of the protection circuitry, the programming equipment must force V_{ID} on address pin A_9 with \overline{CE} and \overline{OE} at V_{IL} and \overline{WE} at V_{IH} . Scanning the sector addresses (A_{19} , A_{18} , A_{17} , A_{16} , A_{15} , A_{14} , A_{13} , and A_{12}) while (A_6 , A_3 , A_2 , A_1 , A_0) = (0, 0, 0, 1, 0) will produce a logical "1" at device output DQ_0 for a protected sector. Otherwise the device will read 00h for an unprotected sector. In this mode, the lower order address, except for A_0 , A_1 , A_2 , A_3 and A_6 are DON'T CAREs. Address locations with $A_1 = V_{IL}$ are reserved for Autoselect manufacturer and device codes. A_{-1} requires to V_{IL} in word mode.

It is also possible to determine if a sector is protected in the system by writing an Autoselect command. Performing a read operation at the address location XX02h, where the higher order address pins (A_{19} , A_{18} , A_{17} , A_{16} , A_{15} , A_{14} , A_{13} and A_{12}) represents the sector address will produce a logical "1" at DQ_0 for a protected sector. See "MBM29PL3200TE/BE Sector Protection Verify Autoselect Codes and Expanded Autoselect Code" Tables for Autoselect codes.

Temporary Sector Unprotection

This feature allows temporary unprotection of previously protected sectors of the device in order to change data. The Sector Unprotection mode is activated by the command register. In this mode, formerly protected sectors can be programmed or erased by selecting the sector addresses. Once the mode is taken away using the command register, all previously protected sectors will be protected again. (See "Figure 22".)

Boot Block Sector Protection

The Write Protection function provides a hardware method of protecting certain “outermost” 16 K word (× 16 mode) sector without using V_{ID}.

If the system asserts V_{IL} on the \overline{WP} pin, the device disables program and erase functions in the “outermost” 16 K word sector independently of whether this sector was protected or unprotected using the method described in “Sector Protection/Unprotection”. The outermost 16 K word sector is the highest addresses in MBM29PL3200TE, or the lowest addresses in MBM29PL3200BE.

(MBM29PL3200TE : SA18, MBM29PL3200BE : SA0)

If the system asserts V_{IL} on the \overline{WP} pin, the device reverts to whether the outermost 16 K word sector was last set to be protected or unprotected. That is, sector protection or unprotection for this sector depends on whether this was last protected or unprotected using the method described in “Sector protection/unprotection”.

Accelerated Program Operation

The device offers accelerated program operation which enables high-speed programming. If the system asserts V_{ACC} to the ACC pin, the device automatically enters the acceleration mode and the time required for program operation will reduce to about 60%. This function is primarily intended to allow high-speed programming, so caution is needed as the sector group will temporarily be unprotected.

The system would use a fast program command sequence when programming during acceleration mode. Set command to fast mode and reset command from fast mode are not necessary. When the device enters the acceleration mode, the device is automatically set to fast mode. Therefore, the present sequence could be used for programming and detection of completion in acceleration mode.

Removing V_{ACC} from the ACC pin returns the device to normal operation. Do not remove V_{ACC} from the ACC pin while programming. See “Figure 16”.

Double Word/Word Configuration

DW/ \overline{W} pin selects double word (32-bit) mode or word (16-bit) mode for the device. When this pin is driven high, the device operates in the double word (32-bit) mode. Data is read and programmed at DQ₃₁ to DQ₀. When this pin is driven low, the device operates in word (16-bit) mode. In this mode, the DQ₃₁/A₋₁ pin becomes the lowest address bit, and DQ₃₀ to DQ₁₆ bits are tri-stated. However, the command bus cycle is always an 16-bit operation and hence commands are written at DQ₁₅ to DQ₀ and DQ₃₁ to DQ₁₆ bits are ignored. Refer to “Figures 12, 13 and 14” for the timing diagram.

■ COMMAND DEFINITIONS

The device operations are selected by writing specific address and data sequences into the command register. MBM29PL3200TE/BE Command Definitions Table defines the valid register command sequences. Note that the Erase Suspend (B0h) and Erase Resume (30h) commands are valid only while the Sector Erase operation is in progress. Moreover both Read/Reset commands are functionally equivalent, resetting the device to the read mode. Note that commands are always written at DQ₇ to DQ₀ and DQ₃₁ to DQ₈ bits are ignored.

Read/Reset Command

In order to return from Autoselect mode or Exceeded Timing Limits (DQ₅ = 1) to Read/Reset mode, the Read/Reset operation is initiated by writing the Read/Reset command sequence into the command register. Microprocessor read cycles retrieve array data from the memory. The device remains enabled for reads until the command register contents are altered.

The device will automatically power-up in the Read/Reset state. In this case, a command sequence is not required to read data. Standard microprocessor read cycles will retrieve array data. This default value ensures that no spurious alteration of the memory content occurs during the power transition. Refer to the “2. AC Characteristics” “(1) Read Only Operations Characteristics” of ■ ELECTRICAL CHARACTERISTICS and “■ TIMING DIAGRAM” for specific timing parameters.

Autoselect Command

Flash memories are intended for use in applications where the local CPU alters memory contents. As such, both manufacture and device codes must be accessible while the device resides in the target system. PROM programmers typically access the signature codes by raising A₉ to a high voltage. However, multiplexing high voltage onto the address lines is not generally desired system design practice.

The device contains an Autoselect command operation to supplement traditional PROM programming methodology. The operation is initiated by writing the Autoselect command sequence into the command register. Following the command write, a read cycle from address XX00h retrieves the manufacture code of 04h. A read cycle at address XX01h (XX02h for Word mode) returns 2222227Eh (227Eh for Word mode) indicating that this device uses an extended device code. The successive read cycle from XX0Eh (XX1Ch for Word mode) to XX0Fh (XX1Eh for Word mode) returns this extended device code for this device. (See “MBM29PL3200TE/BE Sector Protection Verify Autoselect Codes and Expanded Autoselect Code” Tables.)

The sector state (protection or unprotection) will be indicated by address XX02h for × 32 (XX04h for × 16). Scanning the sector addresses (A₁₉, A₁₈, A₁₇, A₁₆, A₁₅, A₁₄, A₁₃ and A₁₂) while (A₆, A₃, A₂, A₁, A₀) = (0, 0, 0, 1, 0) will produce a logical “1” at device output DQ₀ for a protected sector. The programming verification should perform margin mode verification on the protected sector. (See “MBM29PL3200TE/BE User Bus Operations Tables (DW/ \overline{W} = V_{IH} and DW/ \overline{W} = V_{IL})”).

To terminate the operation, it is necessary to write the Read/Reset command sequence into the register.

To execute the Autoselect command during the operation, Read/Reset command sequence must be written before the Autoselect command.

Word/Double Word Programming

The device is programmed on a word-by-word (or double word-by-double word) basis. Programming is a four bus cycle operation. There are two “unlock” write cycles. These are followed by the program set-up command and data write cycles. Addresses are latched on the falling edge of \overline{CE} or \overline{WE} , whichever happens later, and the data is latched on the rising edge of \overline{CE} or \overline{WE} , whichever happens first. The rising edge of the last \overline{CE} or \overline{WE} (whichever happens first) begins programming. Upon executing the Embedded Program Algorithm command sequence, the system is not required to provide further controls or timings. The device will automatically provide adequate internally generated program pulses and verify the programmed cell margin. (See “Figures 6 and 7”.)

The system can determine the status of the program operation by using DQ₇ ($\overline{\text{Data Polling}}$), or DQ₆ (Toggle Bit). The Data Polling and Toggle Bit must be performed at the memory location which is being programmed.

The automatic programming operation is completed when the data on DQ₇ is equivalent to data written to this bit. Then, the device return to the read mode and addresses are no longer latched. (See “Hardware Sequence

Flags” Table, Hardware Sequence Flags.) Therefore, the device requires that a valid address be supplied by the system at this time. Hence, Data Polling must be performed at the memory location which is being programmed.

Programming is allowed in any sequence and across sector boundaries. Beware that a data “0” cannot be programmed back to a “1”. Attempting to do so may either hang up the device or result in an apparent success according to the data polling algorithm but a read from Read/Reset mode will show that the data is still “0”. Only erase operations can convert “0”s to “1”s.

“Figure 17” illustrates the Embedded Program™ Algorithm using typical command strings and bus operations.

Chip Erase

Chip erase is a six-bus cycle operation. There are two “unlock” write cycles. These are followed by writing the “set-up” command. Two more “unlock” write cycles are then followed by the chip erase command.

Chip erase does not require the user to program the device prior to erase. Upon executing the Embedded Erase Algorithm command sequence, the device will automatically program and verify the entire memory for an all-zero data pattern prior to electrical erase (Preprogram Function). The system is not required to provide any controls or timings during these operations.

The system can determine the status of the erase operation by using DQ₇ ($\overline{\text{Data Polling}}$), or DQ₆ (Toggle Bit). The chip erase begins on the rising edge of the last $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens first in the command sequence and terminates when the data on DQ₇ is “1” (See “Write Operation Status”), at which time the device returns to the read mode.

Chip Erase Time = Sector Erase Time × All sectors + Chip Program Time (Preprogramming)

“Figure 18” illustrates the Embedded Erase™ Algorithm using typical command strings and bus operations.

Sector Erase

Sector erase is a six bus cycle operation. There are two “unlock” write cycles. These are followed by writing the “set-up” command. Two more “unlock” write cycles are then followed by the Sector Erase command. The sector address (any address location within the desired sector) is latched on the falling edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens later, while the command (Data = 30h) is latched on the rising edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens first. After time-out of “t_{TOW}” from the rising edge of the last sector erase command, the sector erase operation will begin.

Multiple sectors may be erased concurrently by writing the six bus cycle operations on “MBM29PL3200TE/BE Command definitions” Table. This sequence is followed with writes of the Sector Erase command (30h) to addresses in other sectors desired to be concurrently erased. The time between writes must be less than “t_{TOW}”. Otherwise that command will not be accepted and erasure will not start. It is recommended that processor interrupts be disabled during this time to guarantee such a condition. The interrupts can be reoccur after the last Sector Erase command is written. A time-out of “t_{TOW}” from the rising edge of last $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens first, will initiate the execution of the Sector Erase command (s). If another falling edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens first, occurs within the “t_{TOW}” time-out window, the timer is reset. (Monitor DQ₃ to determine if the sector erase timer window is still open; see “DQ₃”, Sector Erase Timer.) Resetting the device ones execution has begun will corrupt the data in the sector. In that case, restart the erase on those sectors and allow them to complete. (Refer to “Write Operation Status” for Sector Erase Timer operation.) Loading the sector erase buffer may be done in any sequence and with any number of sectors (0 to 19).

Sector erase does not require the user to program the device prior to erase. The device automatically programs all memory locations in the sector (s) to be erased prior to electrical erase (Preprogram function). When erasing a sector or sectors, the rest remain unaffected. The system is not required to provide any controls or timings during these operations.

The system can determine the status of the erase operation by using DQ₇ ($\overline{\text{Data Polling}}$) or DQ₆ (Toggle Bit).

The sector erase begins after the “t_{TOW}” time out from the rising edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$, whichever happens first, for the last sector erase command pulse and terminates when the data on DQ₇ is “1” (See “Write Operation Status”),

at which time the device returns to the read mode. $\overline{\text{Data}}$ polling and Toggle Bit must be performed at an address within any of the sectors being erased.

Multiple Sector Erase Time = [Sector Erase Time + Sector Program Time (Preprogramming)] × Number of Sector Erase.

Erase Suspend/Resume

The Erase Suspend command allows the user to interrupt a Sector Erase operation and then reads data from or programs to a sector not being erased. Erase Suspend command is applicable ONLY during the Sector Erase operation, which includes the time-out period for sector erase. Writing the Erase Suspend command (B0h) during the Sector Erase time-out results in immediate termination of the time-out period and suspension of the erase operation.

Writing the Erase Resume command (30h) resumes the erase operation. The addresses are “DON'T CAREs” when writing the Erase Suspend or Erase Resume command.

When the Erase Suspend command is written during the Sector Erase operation, the device will take a maximum of “ t_{SPD} ” to suspend the erase operation. When the device has entered the erase-suspended mode, the DQ₇ bit will be at logic “1” and DQ₆ will stop toggling. The user must use the address of the erasing sector for reading DQ₆ and DQ₇ to determine if the erase operation has been suspended. Further writes of the Erase Suspend command are ignored.

When the erase operation has been suspended, the device defaults to the erase-suspend-read mode. Reading data in this mode is the same as reading from the standard read mode except that the data must be read from sectors that have not been erase-suspended. Reading successively from the erase-suspended sector while the device is in the erase-suspend-read mode will cause DQ₂ to toggle. (See “DQ₂”.)

After entering the erase-suspend-read mode, the user can program the device by writing the appropriate command sequence for Program. This program mode is known as the erase-suspend-program mode. Again, it is the same as programming in the regular Program mode except that the data must be programmed to sectors that are not erase-suspended. Reading successively from the erase-suspended sector while the device is in the erase-suspend-program mode will cause DQ₂ to toggle. The end of the erase-suspended Program operation is detected by the $\overline{\text{Data}}$ polling of DQ₇ or by the Toggle Bit I (DQ₆), which is the same as the regular Program operation. Note that DQ₇ must be read from the Program address while DQ₆ can be read from any address.

To resume the operation of Sector Erase, the Resume command (30h) should be written. Any further writes of the Resume command at this point will be ignored. Another Erase Suspend command can be written after the chip has resumed erasing.

Extended Command

(1) Fast Mode

The device has a Fast Mode function. It dispenses with the initial two unlock cycles required in the standard program command sequence by writing a Fast Mode command into the command register. In this mode, the required bus cycle for programming consists of two bus cycles instead of four in standard program command. (Do not write erase command in this mode.) The read operation is also executed after exiting from the fast mode. To exit this mode, it is necessary to write a Fast Mode Reset command into the command register. (Refer to "Figure 23".) The V_{CC} active current is required even if $\overline{CE} = V_{IH}$ during Fast Mode.

(2) Fast Programming

During Fast Mode, the programming can be executed with two bus cycle operation. The Embedded Program Algorithm is executed by writing a program set-up command (A0h) and data write cycles (PA/PD). (Refer to "Figure 23".)

(3) CFI (Common Flash Memory Interface)

The CFI (Common Flash Memory Interface) specification outlines the device and host system software interrogation handshake which allows specific vendor-specified software algorithms to be used for entire families of the device. This allows device-independent, JEDEC ID-independent, and forward-and backward-compatible software support for the specified flash device families. Refer to CFI specification in detail.

The operation is initiated by writing the query command (98h) into the command register. Following the command write, a read cycle from specific address retrieves device information. Please note that output data of upper byte (DQ₁₅ to DQ₈) is "0" in word mode (16 bit) read. Refer to "Common Flash Memory Interface Code" Table. To terminate operation, it is necessary to write the Read/Reset command sequence into the register.

HiddenROM Region

The HiddenROM feature provides a Flash memory region that the system may access through a new command sequence. This is primarily intended for customers who wish to use an Electronic Serial Number (ESN) in the device with the ESN protected against modification. Once the HiddenROM region is protected, any further modification of that region is impossible. This ensures the security of the ESN once the product is shipped to the field.

The HiddenROM region is 512 words in length. After the system has written the Enter HiddenROM command sequence, the system may read the HiddenROM region by using device addresses A₇ to A₀ (A₁₁ to A₈ are "00", A₁₉ to A₁₂ are don't care). This mode of operation continues until the system issues the Exit HiddenROM command sequence, or until power is removed from the device. On power-up, the device reverts to sending commands to the address.

HiddenROM Entry Command

The device has a HiddenROM area with One Time Protect function. This area is to enter the security code and to enable the change of the code once set. Program is possible in this area until it is protected. However, once it is protected, it is impossible to unprotect, so please use this with caution.

HiddenROM area is 512 words. This area is normally the "outermost" 16 K word boot block area. Therefore, write the HiddenROM entry command sequence to enter the HiddenROM area. It is called HiddenROM mode when the HiddenROM area appears.

HiddenROM Program Command

To program the data to the HiddenROM area, write the HiddenROM program command sequence during HiddenROM mode. This command is the usual same as the program command except writing the command during HiddenROM mode. Therefore the detection of completion method is the same as in the past, using the DQ₇ data polling, and DQ₆ toggle bit. You should pay attention to the address to be programmed. Use the addresses A₇ to A₀ (A₁₁ to A₈ are "00", A₁₉ to A₁₂ are don't care) .

HiddenROM Protect Command

The method to protect the HiddenROM is to apply high voltage (V_{DD}) to A₉ and \overline{OE} , set the address (A₁₁ to A₈ are "00", A₁₉ to A₁₂ are don't care) in the HiddenROM area and (A₆, A₃, A₂, A₁, A₀) = (0, 0, 0, 1, 0), and apply the write pulse during the HiddenROM mode. To verify the protect circuit, apply high voltage (V_{DD}) to A₉, specify (A₆, A₃, A₂, A₁, A₀) = (0, 0, 0, 1, 0) and the address in the HiddenROM area, and read. When "1" appears on DQ₀, the protect setting is completed. "0" will appear on DQ₀ if it is not protected. Please apply write pulse again. The same command sequence could be used for the above method because other than the HiddenROM mode, it is the same as the sector protect previously mentioned. Please refer to "Sector Protection of FUNCTIONAL DESCRIPTION" for details of the sector protect setting.

Write Operation Status

Detailed in Hardware Sequence Flags Table are all the status flags which can determine the status of the device for the current mode operation. These bits offer a method for determining whether an Embedded Algorithm returns data of memory cells. The information on DQ₂ is address sensitive. This means that if an address from an erasing sector is consecutively read, the DQ₂ bit will toggle. However, DQ₂ will not toggle if an address from a non-erasing sector is consecutively read. This allows users to determine which sectors are in erase and which are not.

Once erase suspend is entered, address sensitivity still applies. If the address of a non-erasing sector (that is, one available for read) is provided, then stored data can be read from the device. If the address of an erasing sector (that is, one unavailable for read) is applied, the device will output its status bits.

Hardware Sequence Flags

Status			DQ ₇	DQ ₆	DQ ₅	DQ ₃	DQ ₂
In Progress	Embedded Program Algorithm		$\overline{\text{DQ}}_7$	Toggle	0	0	1
	Embedded Erase Algorithm		0	Toggle	0	1	Toggle * ¹
	Erase Suspended Mode	Erase Suspend Read (Erase Suspended Sector)	1	1	0	0	Toggle* ¹
		Erase Suspend Read (Non-Erase Suspended Sector)	Data	Data	Data	Data	Data
		Erase Suspend Program (Non-Erase Suspended Sector)	$\overline{\text{DQ}}_7$	Toggle	0	0	1 * ²
Exceeded Time Limits	Embedded Program Algorithm		$\overline{\text{DQ}}_7$	Toggle	1	0	1
	Embedded Erase Algorithm		0	Toggle	1	1	N/A
	Erase Suspend Program (Non-Erase Suspended Sector)		$\overline{\text{DQ}}_7$	Toggle	1	0	N/A

*1: Successive reads from the erasing or erase-suspend sector will cause DQ₂ to toggle.

*2: Reading from non-erase suspend sector address will indicate logic "1" at the DQ₂ bit in the erase suspend program mode.

Notes : •DQ₀ and DQ₁ are reserve pins for future use.

•DQ₄ is Fujitsu internal use only.

• DQ₁₅ to DQ₈ at Word Mode and DQ₃₁ to DQ₈ at Double Word Mode are Don't Care.

DQ₇

Data Polling

The device features $\overline{\text{Data}}$ Polling as a method to indicate to the host that the Embedded Algorithms are in progress or completed. During the Embedded Program Algorithm, an attempt to read the device will produce a complement of data last written to DQ₇. Upon completion of the Embedded Program Algorithm, an attempt to read the device will produce true data last written to DQ₇. During the Embedded Erase Algorithm, an attempt to read the device will produce a “0” at the DQ₇ output. Upon completion of the Embedded Erase Algorithm an attempt to read the device will produce a “1” on DQ₇. The flowchart for $\overline{\text{Data}}$ Polling (DQ₇) is shown in “Figure 19”.

For programming, the $\overline{\text{Data}}$ Polling is valid after the rising edge of the fourth write pulse in the four write pulse sequence.

For chip erase and sector erase, the $\overline{\text{Data}}$ Polling is valid after the rising edge of the sixth write pulse in the six write pulse sequence. $\overline{\text{Data}}$ Polling must be performed at the sector address of sectors being erased, not protected sectors. Otherwise, the status may become invalid.

If a program address falls within a protected sector, $\overline{\text{Data}}$ Polling on DQ₇ is active for approximately 1 μs , then that bank returns to the read mode. After an erase command sequence is written, if all sectors selected for erasing are protected, $\overline{\text{Data}}$ Polling on DQ₇ is active for approximately 400 μs , then the bank returns to read mode.

Once the Embedded Algorithm operation is close to being completed, the device data pin (DQ₇) may change asynchronously while the output enable ($\overline{\text{OE}}$) is asserted low. This means that the device is driving status information on DQ₇ at one instant and then that byte's valid data at the next instant of time. Depending on when the system samples the DQ₇ output, it may read the status or valid data. Even if the device has completed the Embedded Algorithm operation and DQ₇ has valid data, data outputs on DQ₆ to DQ₀ may be still invalid. The valid data on DQ₇ to DQ₀ will be read on successive read attempts.

The Data Polling feature is active only during the Embedded Programming Algorithm, Embedded Erase Algorithm or sector erase time-out. (See “Toggle Bit Status” Table.)

See “Figure 9” for the $\overline{\text{Data}}$ Polling timing specifications and diagrams.

DQ₆

Toggle Bit I

The device also features the “Toggle Bit I” as a method to indicate to the host system that the Embedded Algorithms are in progress or completed.

During the Embedded Program or Erase Algorithm cycle, successive attempts to read ($\overline{\text{OE}}$ toggling) data from the device will result in DQ₆ toggling between 1 and 0. Once the Embedded Program or Erase Algorithm cycle is completed, DQ₆ will stop toggling and valid data will be read on the next successive attempts. During programming, the Toggle Bit I is valid after the rising edge of the fourth write pulse in the four write pulse sequence. For chip erase and sector erase, the Toggle Bit I is valid after the rising edge of the sixth write pulse in the six write pulse sequence. The Toggle Bit I is active during the sector time out.

In programming, if the sector being written is protected, the toggle bit will toggle for about 1 μs and then stop toggling with data unchanged. In erase, device will erase all selected sectors except for ones that are protected. If all selected sectors are protected, the chip will toggle the toggle bit for about 400 μs and then drop back into read mode, having data kept remained.

Either $\overline{\text{CE}}$ or $\overline{\text{OE}}$ toggling will cause DQ₆ to toggle. In addition, an Erase Suspend/Resume command will cause DQ₆ to toggle.

See “Figure 10 and 20” for the Toggle Bit I timing specifications and diagrams.

DQ₅

Exceeded Timing Limits

DQ₅ will indicate if the program or erase time has exceeded the specified limits (internal pulse count). Under these conditions DQ₅ will produce a “1”. This is a failure condition which indicates that the program or erase cycle was not successfully completed. $\overline{\text{Data}}$ Polling is only operating function of device under this condition. The $\overline{\text{CE}}$ circuit will partially power down device under these conditions (to approximately 2 mA). The $\overline{\text{OE}}$ and $\overline{\text{WE}}$ pins will control the output disable functions as described in “MBM29PL3200TE/BE User Bus Operations Tables ($\text{DW}/\overline{\text{W}} = \text{V}_{\text{IH}}$ and $\text{DW}/\overline{\text{W}} = \text{V}_{\text{IL}}$)”.

The DQ₅ failure condition may also appear if a user tries to program a non-blank location without pre-erase. In this case the device locks out and never completes the Embedded Algorithm operation. Hence, the system never reads valid data on DQ₇ bit and DQ₆ never stops toggling. Once the device has exceeded timing limits, the DQ₅ bit will indicate a “1.” Please note that this is not a device failure condition since the device was incorrectly used. If this occurs, reset the device with the command sequence.

DQ₃

Sector Erase Timer

After completion of the initial sector erase command sequence, sector erase time-out will begin. DQ₃ will remain low until the time-out is completed. $\overline{\text{Data}}$ Polling and Toggle Bit are valid after the initial sector erase command sequence.

If $\overline{\text{Data}}$ Polling or the Toggle Bit I indicates that a valid erase command has been written, DQ₃ may be used to determine whether the sector erase timer window is still open. If DQ₃ is high (“1”), the internally controlled erase cycle has begun; if DQ₃ is low (“0”), the device will accept additional sector erase commands. To insure the command has been accepted, the system software should check the status of DQ₃ prior to and following each subsequent Sector Erase command. If DQ₃ is high on the second status check, the command may not have been accepted.

See “Hardware Sequence Flags” Table

DQ₂

Toggle Bit II

This toggle bit II, along with DQ₆, can be used to determine whether the device is in the Embedded Erase Algorithm or in Erase Suspend.

Successive reads from the erasing sector will cause DQ₂ to toggle during the Embedded Erase Algorithm. If the device is in the erase-suspended-read mode, successive reads from the erase-suspended sector will cause DQ₂ to toggle. When the device is in the erase-suspended-program mode, successive reads from the non-erase suspended sector will indicate a logic “1” at the DQ₂ bit.

DQ₆ is different from DQ₂ in that DQ₆ toggles only when the standard program or Erase, or Erase Suspend Program operation is in progress. The behavior of these two status bits, along with that of DQ₇, is summarized as follows :

For example, DQ₂ and DQ₆ can be used together to determine if the erase-suspend-read mode is in progress. (DQ₂ toggles while DQ₆ does not.) See also “Toggle Bit Status” Table.

Furthermore DQ₂ can also be used to determine which sector is being erased. At the erase mode, DQ₂ toggles if this bit is read from an erasing sector.

Reading Toggle Bits DQ₆/DQ₂

Whenever the system initially begins reading toggle bit status, it must read DQ₇ to DQ₀ at least twice in a row to determine whether a toggle bit is toggling. Typically a system would note and store the value of the toggle bit after the first read. After the second read, the system would compare the new value of the toggle bit with the first. If the toggle bit is not toggling, the device has completed the program or erase operation. The system can read array data on DQ₇ to DQ₀ on the following read cycle.

However, if, after the initial two read cycles, the system determines that the toggle bit is still toggling, the system also should note whether the value of DQ₅ is high (see “DQ₅”). If it is, the system should then determine again whether the toggle bit is toggling, since the toggle bit may have stopped toggling just as DQ₅ went high. If the toggle bit is no longer toggling, the device has successfully completed the program or erase operation. If it is still toggling, the device did not complete the operation successfully, and the system must write the reset command to return to reading array data.

The remaining scenario is that the system initially determines that the toggle bit is toggling and DQ₅ has not gone high. The system may continue to monitor the toggle bit and DQ₅ through successive read cycles, determining the status as described in the previous paragraph. Alternatively, it may choose to perform other system tasks. In this case, the system must start at the beginning of the algorithm when it returns to determine the status of the operation. (Refer to “Figure 20”.)

Toggle Bit Status

Mode	DQ ₇	DQ ₆	DQ ₂
Program	$\overline{\text{DQ}}_7$	Toggle	1
Erase	0	Toggle	Toggle (Note)
Erase-Suspend Read (Erase-Suspended Sector)	1	1	Toggle
Erase-Suspend Program	$\overline{\text{DQ}}_7$	Toggle	1 (Note)

Note : Successive reads from the erasing or erase-suspend sector will cause DQ₂ to toggle. Reading from non-erase suspend sector address will indicate logic “1” at the DQ₂ bit.

Data Protection

The device is designed to offer protection against accidental erasure or programming caused by spurious system level signals that may exist during power transitions. During power-up, the device automatically resets the internal state machine to Read mode. Also, with its control register architecture, alteration of memory contents only occurs after successful completion of the specific multi-bus cycle command sequence.

The device also incorporates several features to prevent inadvertent write cycles resulting from V_{CC} power-up and power-down transitions or system noise.

Low V_{CC} Write Inhibit

To avoid initiation of a write cycle during V_{CC} power-up and power-down, a write cycle is locked out for V_{CC} less than V_{LKO} (Min). If $V_{CC} < V_{LKO}$, the command register is disabled and all internal program/erase circuits are disabled. Under this condition, the device will reset to the read mode. Subsequent writes will be ignored until the V_{CC} level is greater than V_{LKO} . It is the user's responsibility to ensure that the control pins are logically correct to prevent unintentional writes when V_{CC} is above V_{LKO} (Min).

If the Embedded Erase Algorithm is interrupted, the intervened erasing sector (s) is (are) not valid.

Write Pulse “Glitch” Protection

Noise pulses of less than 3 ns (typical) on \overline{OE} , \overline{CE} , or \overline{WE} will not initiate a write cycle.

Logical Inhibit

Writing is inhibited by holding any one of $\overline{OE} = V_{IL}$, $\overline{CE} = V_{IH}$, or $\overline{WE} = V_{IH}$. To initiate a write cycle, \overline{CE} and \overline{WE} must be “L” while \overline{OE} is a logical one.

Power-up Write Inhibit

Power-up of the device with $\overline{WE} = \overline{CE} = V_{IL}$ and $\overline{OE} = V_{IH}$ will not accept commands on the rising edge of \overline{WE} . The internal state machine is automatically reset to read mode on power-up.

MBM29PL3200TE_{70/90}/MBM29PL3200BE_{70/90}

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating		Unit
		Min	Max	
Storage Temperature	T _{stg}	−55	+125	°C
Ambient Temperature with Power Applied	T _A	−40	+85	°C
Voltage with Respect to Ground All pins except A ₉ , $\overline{\text{OE}}$, and ACC * ¹	V _{IN} , V _{OUT}	−0.5	V _{CC} + 0.5	V
Power Supply Voltage * ¹	V _{CC}	−0.5	+4.0	V
A ₉ , $\overline{\text{OE}}$, and ACC * ²	V _{IN}	−0.5	+13.0	V

*1: Minimum DC voltage on input or I/O pins is −0.5 V. During voltage transitions, input or I/O pins may undershoot V_{SS} to −2.0 V for periods of up to 20 ns. Maximum DC voltage on input or I/O pins is V_{CC} + 0.5 V. During voltage transitions, input or I/O pins may overshoot to V_{CC} + 2.0 V for periods of up to 20 ns.

*2: Minimum DC input voltage on A₉, $\overline{\text{OE}}$ and ACC pins is −0.5 V. During voltage transitions, A₉, $\overline{\text{OE}}$ and ACC pins may undershoot V_{SS} to −2.0 V for periods of up to 20 ns. Voltage difference between input and supply voltage (V_{IN} − V_{CC}) does not exceed +9.0 V. Maximum DC input voltage on A₉, $\overline{\text{OE}}$ and ACC pins is +13.0 V which may overshoot to +14.0 V for periods of up to 20 ns.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Part No.	Value		Unit
			Min	Max	
Ambient Temperature	T _A	MBM29PL3200TE/BE 70	−40	+85	°C
		MBM29PL3200TE/BE 90			
Power Supply Voltage	V _{CC}	MBM29PL3200TE/BE 70	+3.0	+3.6	V
		MBM29PL3200TE/BE 90	+2.7	+3.6	

Note: Operating ranges define those limits between which the functionality of the device is quaranteed.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

		Double Word		—	50	
V _{CC} Active Current (Program/Erase) *2	I_{CC2}	$\overline{CE} = V_{IL}$, $\overline{OE} = V_{IH}$	—	—	80	mA
V _{CC} Current (Standby)	I_{CC3}	$V_{CC} = V_{CC}$ Max, $\overline{CE} = V_{CC} \pm 0.3$ V	—	1	5	μA
V _{CC} Current (Automatic Sleep Mode) *3	I_{CC4}	$V_{CC} = V_{CC}$ Max, $\overline{CE} = V_{SS} \pm 0.3$ V, $V_{IN} = V_{CC} \pm 0.3$ V or $V_{SS} \pm 0.3$ V	—	1	5	μA
V _{CC} Active Current (Page Read Mode)	I_{CC5}	$\overline{CE} = V_{IL}$, $\overline{OE} = V_{IH}$	—	—	12	mA
		30 MHz	—	—	15	
ACC Accelerated Program Current	I_{ACC}	$V_{CC} = V_{CC}$ Max, ACC = V _{ACC} Max	—	—	20	mA
Input Low Level	V_{IL}	—	-0.5	—	0.8	V
Input High Level	V_{IH}	—	2.0	—	$V_{CC} + 0.3$	V
Voltage for Program Acceleration *5, *6	V_{ACC}	—	11.5	—	12.5	V
Voltage for Autoselect and Sector Protection (A ₉ , \overline{OE}) *4, *5, *6	V_{ID}	—	11.5	12	12.5	V
Output Low Voltage Level	V_{OL}	$I_{OL} = 4.0$ mA, $V_{CC} = V_{CC}$ Min	—	—	0.45	V
Output High Voltage Level	V_{OH1}	$I_{OH} = -2.0$ mA, $V_{CC} = V_{CC}$ Min	2.4	—	—	V
	V_{OH2}	$I_{OH} = -100$ μA	$V_{CC} - 0.4$	—	—	V
Low V _{CC} Lock-Out Voltage	V_{LKO}	—	2.3	2.4	2.5	V

*1: The I_{CC} current listed includes both the DC operating current and the frequency dependent component.

*2: I_{CC} active while Embedded Erase or Embedded Program is in progress.

*3: Automatic sleep mode enables the low power mode when address remains stable for 150 ns.

*4: Only for Sector Protection and Autoselect mode

*5: Power supply Voltage on ■ RECOMMENDED OPERATING CONDITIONS must be applied into V_{CC} pin.

*6 : ($V_{ID} - V_{CC}$) or ($V_{ACC} - V_{CC}$) do not exceed 9 V.

■ AC Characteristics

(1) Read Only Operations Characteristics

Parameter	Symbol		Condition	Value				Unit
	JEDEC	Standard		70 *1		90 *2		
				Min	Max	Min	Max	
Read Cycle Time	t _{AVAV}	t _{RC}	—	70	—	90	—	ns
Address to Output Delay	t _{AVQV}	t _{ACC}	$\overline{CE} = V_{IL},$ $\overline{OE} = V_{IL}$	—	70	—	90	ns
Page Read Cycle Time	—	t _{PRC}	—	25	—	35	—	ns
Page Address to Output Delay	—	t _{PACC}	$\overline{CE} = V_{IL}$ $\overline{OE} = V_{IL}$	—	25	—	35	ns
Chip Enable to Output Delay	t _{ELQV}	t _{CE}	$\overline{OE} = V_{IL}$	—	70	—	90	ns
Output Enable to Output Delay	t _{GLQV}	t _{OE}	—	—	25	—	35	ns
Chip Enable to Output High-Z	t _{EHQZ}	t _{DF}	—	—	25	—	30	ns
Output Enable to Output High-Z	t _{GHQZ}	t _{DF}	—	—	25	—	30	ns
Output Hold Time From Address, CE or OE, Whichever Occurs First	t _{AXQX}	t _{OH}	—	4	—	5	—	ns
\overline{CE} to DW/\overline{W} Switching Low or High	—	t _{ELFL} t _{ELFH}	—	—	5	—	5	ns

*1: Test Conditions :

Output Load : 1 TTL gate and 50 pF

Input rise and fall times : 5 ns

Input pulse levels : 0.0 V or 3.0 V

Timing measurement reference level

Input : 1.5 V

Output : 1.5 V

*2 Test Conditions :

Output Load : 1 TTL gate and 100 pF

Input rise and fall times : 5 ns

Input pulse levels : 0.0 V or 3.0 V

Timing measurement reference level

Input : 1.5 V

Output : 1.5 V

Notes: C_L = 50 pF including jig capacitance (MBM29PL3200TE70, MBM29PL3200BE70)

C_L = 100 pF including jig capacitance (MBM29PL3200TE90, MBM29PL3200BE90)

***1: Test Conditions :**

Output Load : 1 TTL gate and 50 pF
Input rise and fall times : 5 ns
Input pulse levels : 0.0 V to 3.0 V
Timing measurement reference level
Input : 1.5 V
Output : 1.5 V

***2 Test Conditions :**

Output Load : 1 TTL gate and 100 pF
Input rise and fall times : 5 ns
Input pulse levels : 0.0 V to 3.0 V
Timing measurement reference level
Input : 1.5 V
Output : 1.5 V

***3:** This does not include the preprogramming time.

***4:** This timing is for Sector Protection operation.

***5:** This timing is for Accelerated Program operation.

MBM29PL3200TE_{70/90}/MBM29PL3200BE_{70/90}

■ ERASE AND PROGRAMMING PERFORMANCE

Parameter	Value			Unit	Comments
	Min	Typ	Max		
Sector Erase Time	—	4	40	s	Excludes programming time prior to erasure
Word Programming Time	—	14.3	360	μs	Excludes system-level overhead
Double Word Programming Time	—	18.3	480		
Chip Programming Time	—	20	280	s	Excludes system-level overhead
Erase/Program Cycle	100,000	—	—	cycle	—

■ PIN CAPACITANCE

1. SSOP

Parameter	Symbol	Condition	Value		Unit
			Typ	Max	
Input Capacitance	C _{IN}	V _{IN} = 0	6.0	7.5	pF
Output Capacitance	C _{OUT}	V _{OUT} = 0	8.0	10.0	pF
Control Pin Capacitance	C _{IN2}	V _{IN} = 0	8.0	10.0	pF

Note : Test conditions T_A = +25 °C, f = 1.0 MHz

2. FBGA

Parameter	Symbol	Condition	Value		Unit
			Typ	Max	
Input Capacitance	C _{IN}	V _{IN} = 0	6.0	7.5	pF
Output Capacitance	C _{OUT}	V _{OUT} = 0	8.0	10.0	pF
Control Pin Capacitance	C _{IN2}	V _{IN} = 0	8.0	10.0	pF

Note : Test conditions T_A = +25 °C, f = 1.0 MHz

SWITCHING WAVEFORMS

Key to Switching Waveforms

WAVEFORM	INPUTS	OUTPUTS
	Must Be Steady	Will Be Steady
	May Change from H to L	Will Be Change from H to L
	May Change from L to H	Will Be Change from L to H
	"H" or "L": Any Change Permitted	Changing, State Unknown
	Does Not Apply	Center Line is High-Z "Off" State

TIMING DIAGRAM

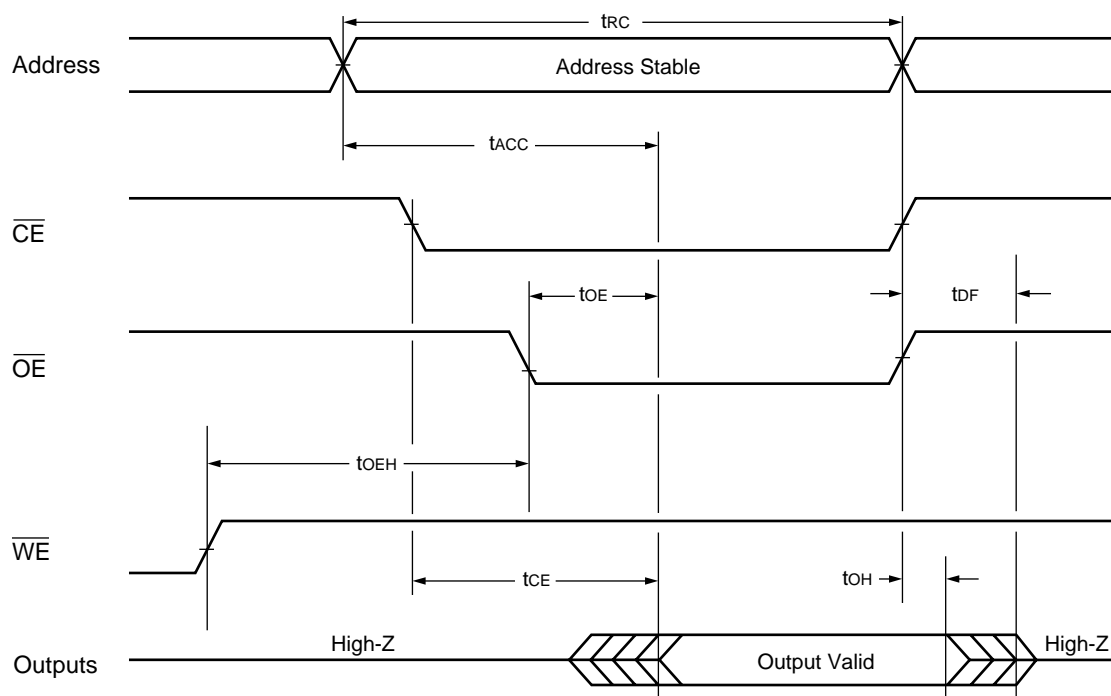

Figure 5.1 Read Operation Timing Diagram

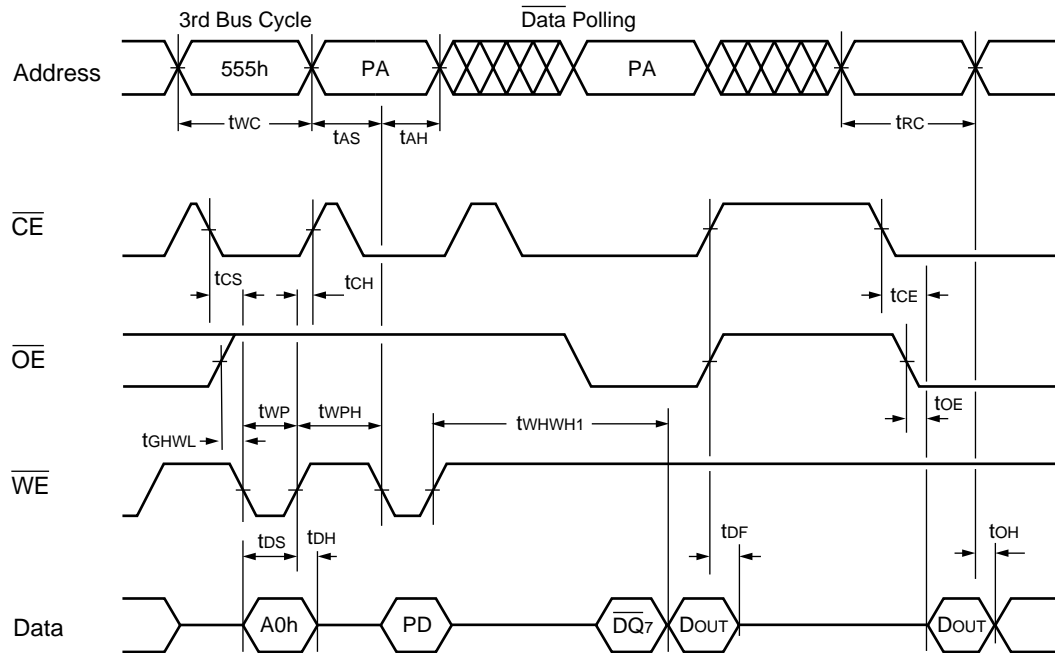

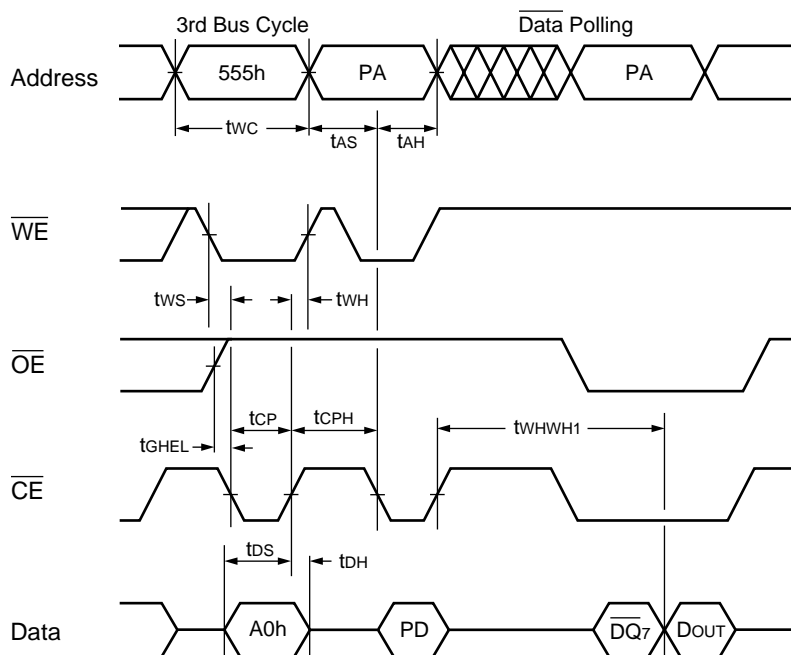

Figure 5.2 Page Read Operation Timing Diagram

- Notes :
- PA is address of the memory location to be programmed.
 - PD is data to be programmed at word address.
 - $\overline{DQ_7}$ is the output of the complement of the data written to the device.
 - DOUT is the output of the data written to the device.
 - Figure indicates last two bus cycles out of four bus cycle sequence.
 - These waveforms are for the $\times 32$ mode. (The addresses differ from $\times 16$ mode.)

Figure 6 Alternate \overline{WE} Controlled Program Operation Timing Diagram

- Notes :
- PA is address of the memory location to be programmed.
 - PD is data to be programmed at word address.
 - \overline{DQ}_7 is the output of the complement of the data written to the device.
 - D_{OUT} is the output of the data written to the device.
 - Figure indicates last two bus cycles out of four bus cycle sequence.
 - These waveforms are for the × 32 mode. (The addresses differ from × 16 mode.)

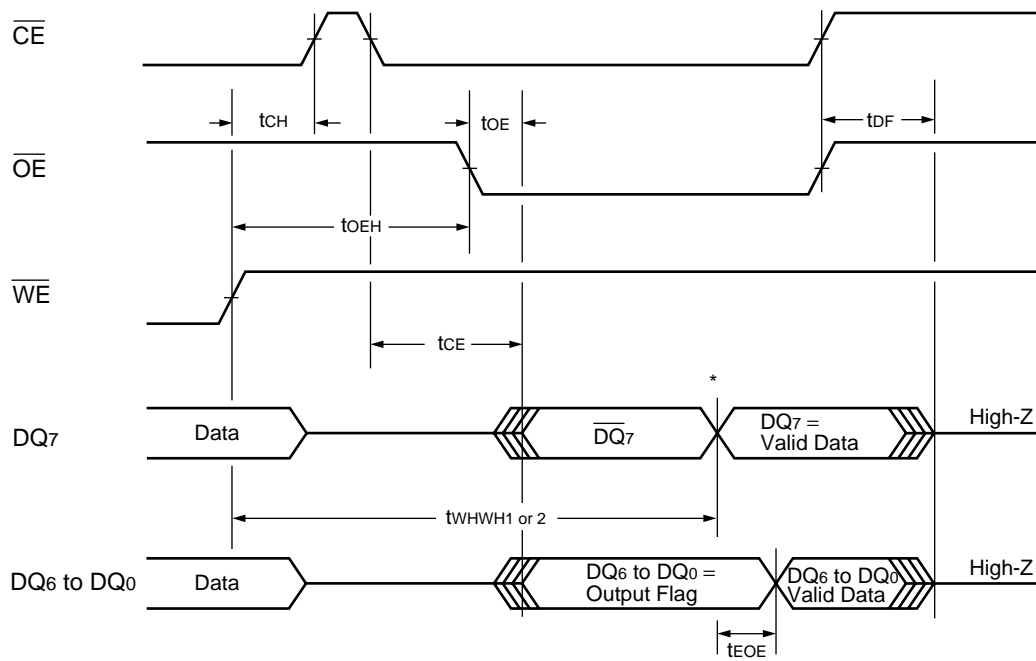

Figure 7 Alternate \overline{CE} Controlled Program Operation Timing Diagram

* : SA is the sector address for Sector Erase. Addresses = 555h (Double Word), AAh (Word) for Chip Erase.

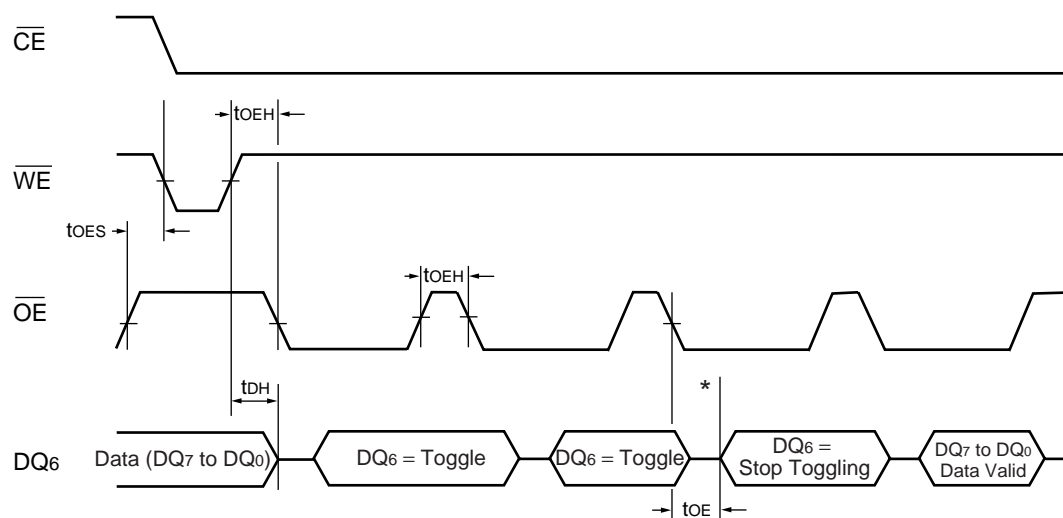

Note: These waveforms are for the $\times 32$ mode (the addresses differ from $\times 16$ mode.)

Figure 8 Chip/Sector Erase Operation Timing Diagram

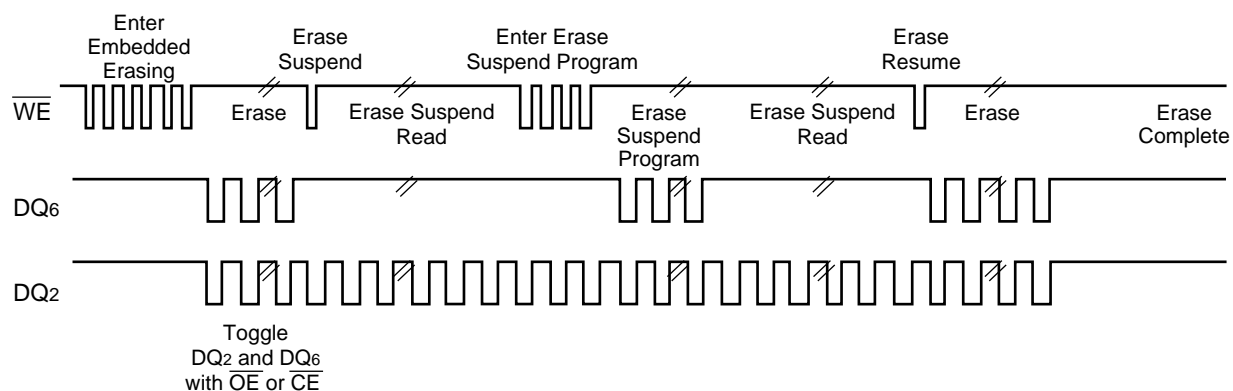

* : DQ₇ = Valid Data (The device has completed the Embedded operation)

Figure 9 Data Polling during Embedded Algorithm Operation Timing Diagram

* : DQ₆ = Stops toggling. (The device has completed the Embedded operation.)

■ FLOW CHART

EMBEDDED ALGORITHM

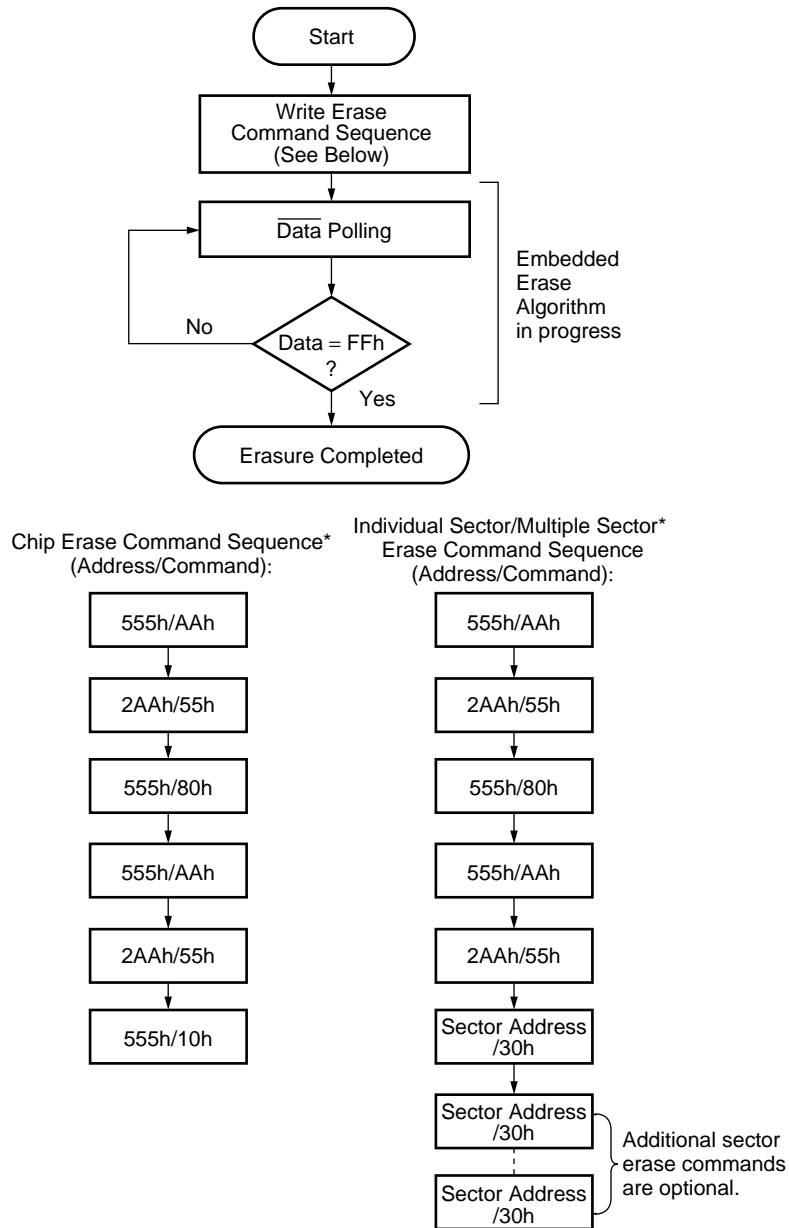

Program Command Sequence* (Address/Command):

* : The sequence is applied for × 32 mode.
The addresses differ from × 16 mode.

Figure 17 Embedded Program™ Algorithm

EMBEDDED ALGORITHM

* : The sequence is applied for × 32 mode.
The addresses differ from × 16 mode.

Figure 18 Embedded Erase™ Algorithm

VA = Address for programming
 = Any of the sector addresses within the sector being erased during sector erase or multiple erases operation.
 = Any of the sector addresses within the sector not being protected during sector erase or multiple sector erases operation.

* : DQ₇ should be rechecked even if DQ₅ = "1" because DQ₇ may change simultaneously with DQ₅.

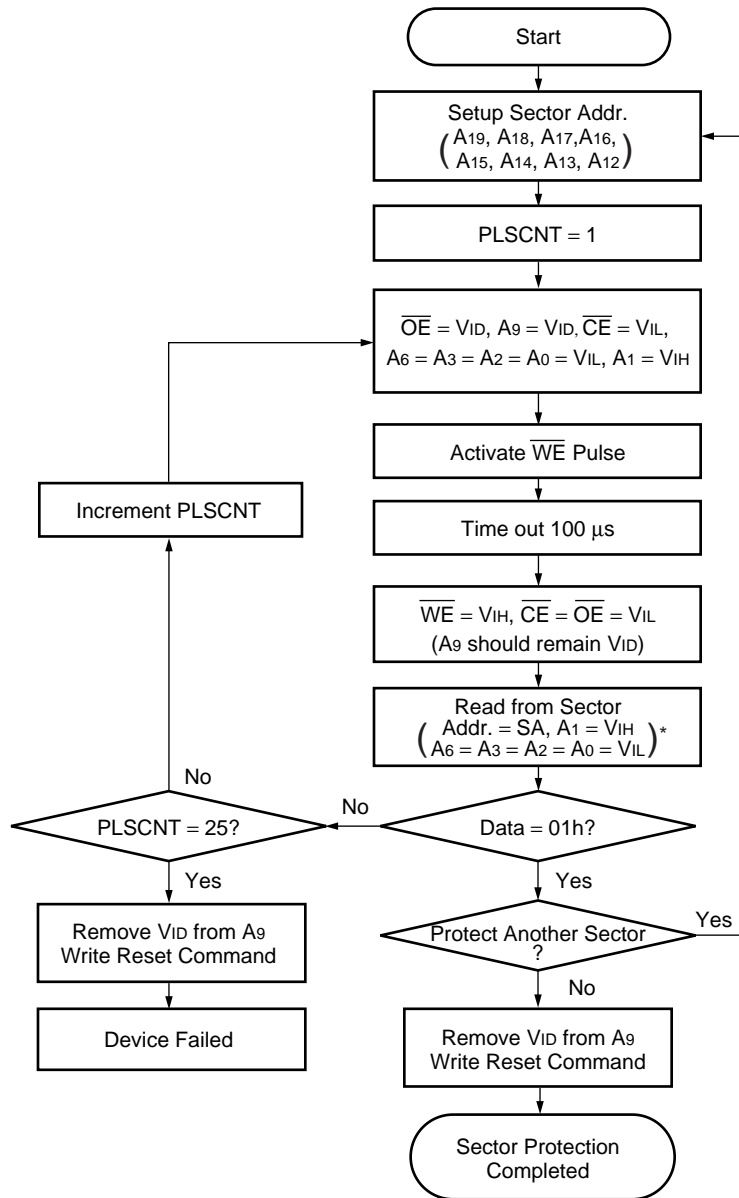

Figure 19 Data Polling Algorithm

*1: Read toggle bit twice to determine whether it is toggling.

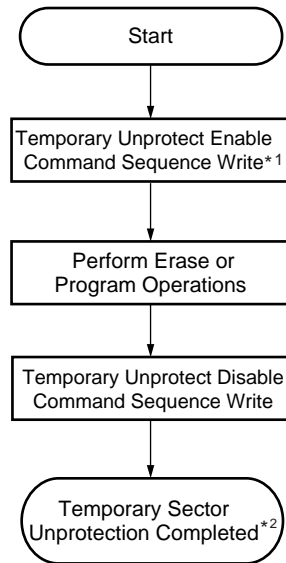

*2: Recheck toggle bit because it may stop toggling as DQ₅ changes to "1".

Figure 20 Toggle Bit Algorithm

* : A-1 is V_{IL} on word mode.

Figure 21 Sector Protection Algorithm

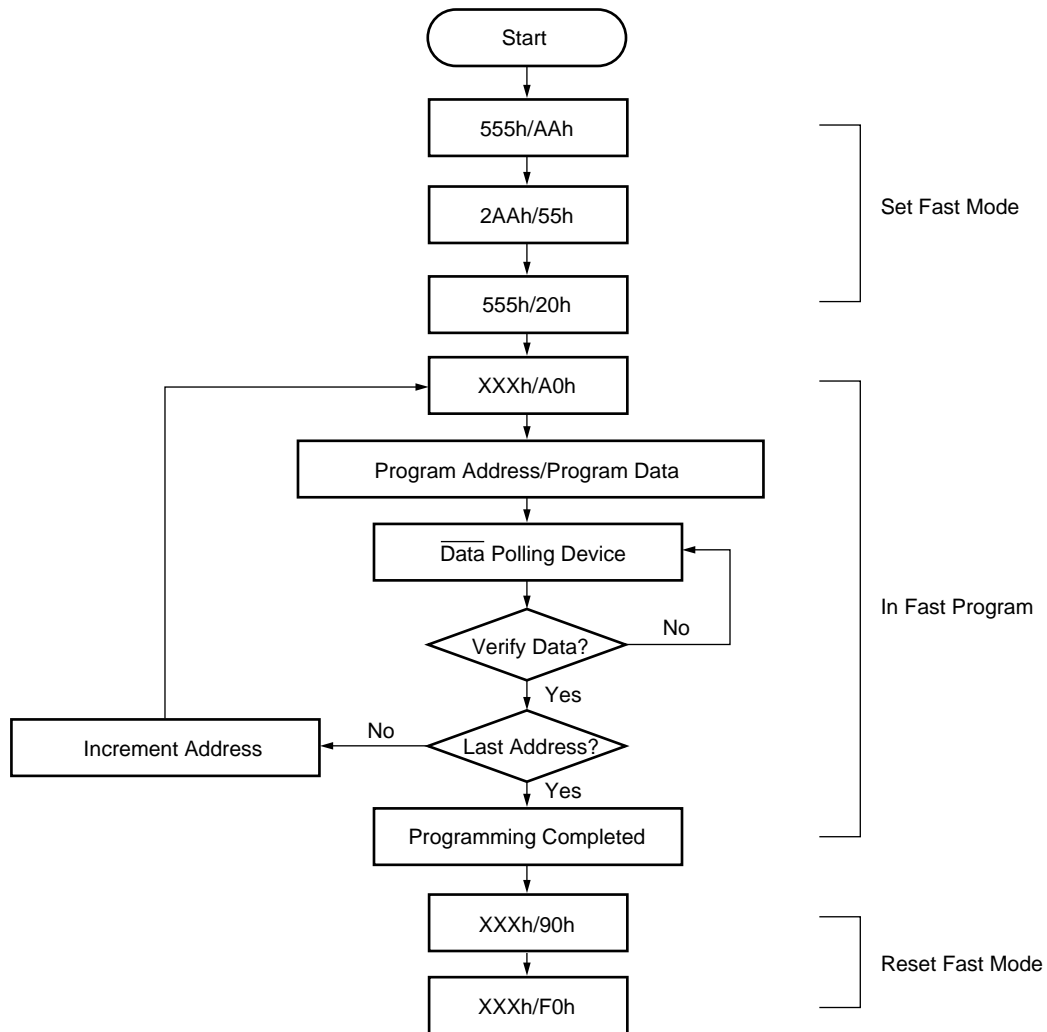

*1: All protected sectors are unprotected.

*2: All previously protected sectors are protected once again.

Figure 22 Temporary Sector Unprotection Algorithm

FAST MODE ALGORITHM

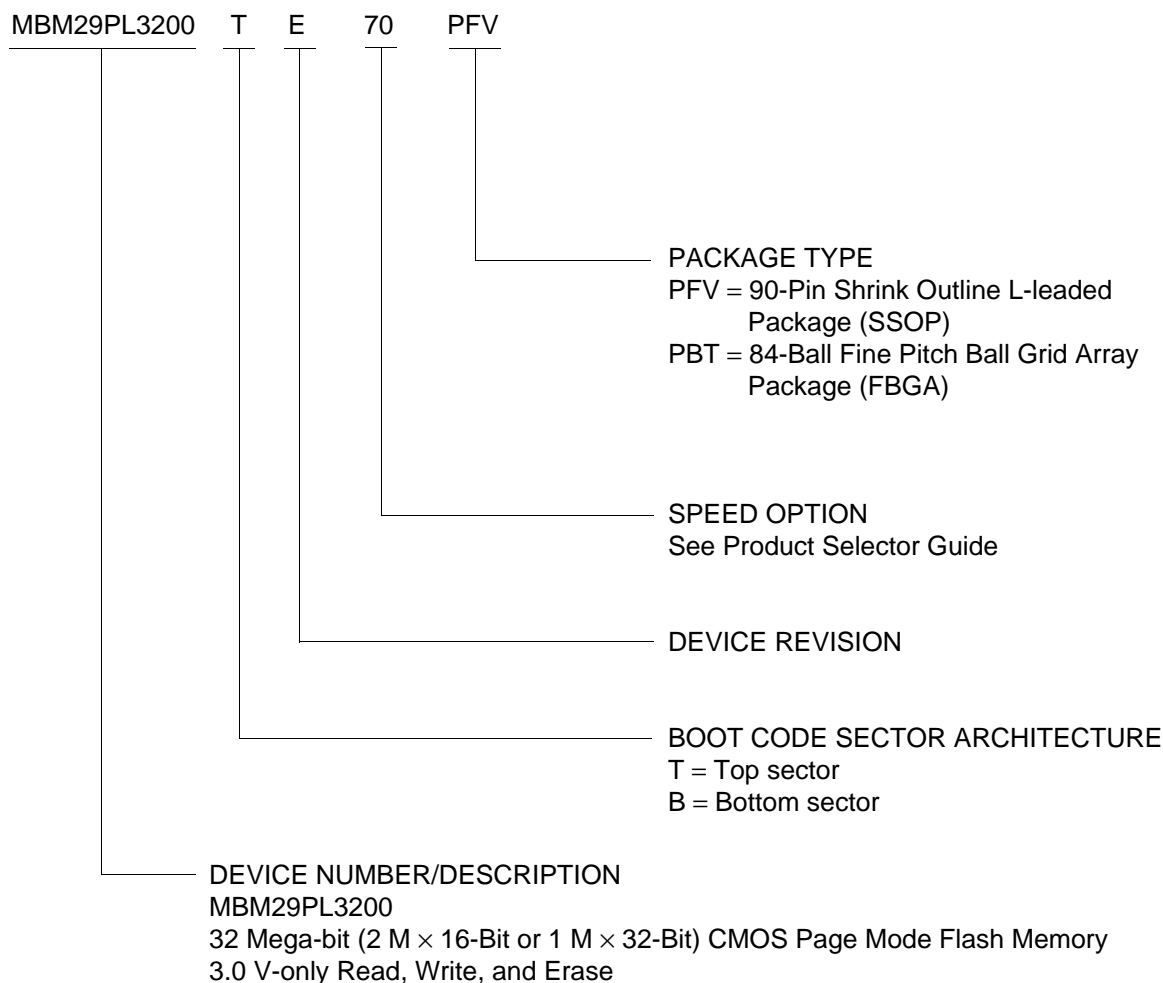

- Notes :
- The sequence is applied for $\times 32$ mode.
 - The addresses differ from $\times 16$ mode.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
