● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

PHASE CONTROL APPLICATION

In case of using in phase control application. Δt must be at least 1ms (Δt : The time starting from the end of INPUT SIGNAL "point a" to the point at which load current become ZERO "point b"). And, Load current " I_T " at "point a" must be at least double the maximum Holding Current (I_H) specification in each operating temperature.
