

# CS4201

# CrystalClear<sup>®</sup> Audio Codec '97 with Headphone Amplifier

#### Features

- Integrated High-Performance Headphone Amplifier
- On-chip PLL for use with External Clock Sources
- Sample Rate Converters
- S/PDIF Digital Audio Output
- AC '97 2.1 Compliant
- 20-bit Stereo Digital-to-Analog Converters
- 18-bit Stereo Analog-to-Digital Converters
- Three Analog Line-level Stereo Inputs for LINE IN, VIDEO, and AUX
- Two Analog Line-level Mono Inputs for Modem and PC Beep
- Dual Microphone Inputs
- High Quality Pseudo-Differential CD Input
- Integrated High-Performance Microphone Pre-Amplifier
- Separate Stereo Line-level Output
- Extensive Power Management Support

- Meets or Exceeds the Microsoft<sup>®</sup> PC 99 and PC 2001 Audio Performance Requirements
- CrystalClear<sup>©</sup> 3D Stereo Enhancement
- I<sup>2</sup>S Serial Digital Outputs Enable Cost Effective Six Channel Applications

# Description

The CS4201 is an AC '97 2.1 compliant stereo audio codec designed for PC multimedia systems. It uses industry leading CrystalClear<sup>®</sup> delta-sigma and mixed signal technology. This advanced technology and these features are designed to help enable the design of PC 99 and PC 2001 compliant high-quality audio systems for desktop, portable, and entertainment PCs.

Coupling the CS4201 with a PCI audio accelerator or core logic supporting the AC '97 interface, implements a cost effective, superior quality audio solution. The CS4201 surpasses PC 99, PC 2001, and AC '97 2.1 audio quality standards.

#### **ORDERING INFO**

#### 1. CHARACTERISTICS AND SPECIFICATIONS

**ANALOG CHARACTERISTICS** (Standard test conditions unless otherwise noted:  $T_{ambient} = 25^{\circ}$  C, AVdd = 5.0 V ±5%, DVdd = 3.3 V ±5%; 1 kHz Input Sine wave; Sample Frequency, Fs = 48 kHz;  $Z_{AL}$ =100 kΩ/ 1000 pF load for Mono and Line Outputs;  $C_{DL}$  = 18 pF load (Note 1); Measurement bandwidth is 20 Hz - 20 kHz, 18-bit linear coding for ADC functions, 20-bit linear coding for DAC functions; Mixer registers set for unity gain.

| Parameter   | Symbol | Path     |        | CS4201-JQ |        |                  |

Notes: 1. Z<sub>AL</sub> refers to the analog output pin loading and C<sub>DL</sub> refers to the digital output pin loading.

2. Parameter definitions are given in Section 13, Parameter and Term Definitions.

3. Path refers to the signal path used to generate this data. These paths are defined in Section 13, *Parameter and Term Definitions.* 

4. This specification is guaranteed by silicon characterization; it is not production tested.

#### 2. GENERAL DESCRIPTION

The CS4201 is a mixed-signal serial audio codec with integrated headphone power amplifier compliant with the Intel® Audio Codec '97 Specification, revision 2.1 [6] (referred to as AC '97). It is designed to be paired with a digital controller, typically located on the PCI bus or integrated within the system core logic chip set. The controller is responsible for all communications between the CS4201 and the remainder of the system. The CS4201 contains two distinct functional sections: digital and analog. The digital section includes the AC-link interface, S/PDIF interface, serial data port, GPIO, power management support, and Sample Rate Converters (SRCs). The analog section includes the analog input multiplexer (mux), stereo input mixer, stereo output mixer, mono output mixer, headphone amplifier, stereo Analog-to-Digital Converters (ADCs), stereo Digital-to-Analog Converters (DACs), and their associated volume controls.

#### 2.1 AC-Link

All communication with the CS4201 is established with a 5-wire digital interface to the controller called the AC-link. This interface is shown in Figure 7. All clocking for the serial communication is synchronous to the BIT\_CLK signal. BIT\_CLK is generated by the primary audio codec and is used to clock the controller and any secondary audio codecs. Both input and output AC-link audio frames are organized as a sequence of 256 serial bits forming 13 groups referred to as 'slots'. During each audio frame, data is passed bi-directionally between the CS4201 and the controller. The input frame is driven from the CS4201 on the SDATA\_IN line. The output frame is driven from the controller on the SDATA\_OUT line. The controller is also responsible for issuing reset commands via the RE-SET# signal. Following a Cold Reset, the CS4201 is responsible for notifying the controller that it is ready for operation after synchronizing its internal functions. The CS4201 AC-link signals must use the same digital supply voltage as the controller, either +5 V or +3.3 V. See Section 3, AC-Link Frame Definition, for detailed AC-link information.

Figure 7. AC-link Connections

#### 2.2 Control Registers

The CS4201 contains a set of AC '97 compliant control registers, and a set of Cirrus Logic defined control registers. These registers control the basic functions and features of the CS4201. Read accesses of the control registers by the AC '97 controller are accomplished with the requested register index in Slot 1 of a SDATA\_OUT frame. The following SDATA\_IN frame will contain the read data in its Slot 2. Write operations are similar, with the register index in Slot 1 and the write data in Slot 2 of a SDATA\_OUT frame. The function of each input and output frame is detailed in Section 3, *AC-Link Frame Definition*. Individual register descriptions are found in Section 4, *Register Interface*.

#### 2.3 Sample Rate Converters

The sample rate converters (SRC) provide high accuracy digital filters supporting sample frequencies other than 48 kHz to be captured from the CS4201 or played from the controller. AC '97 requires support for two audio rates (44.1 and 48 kHz). In addition, the Intel<sup>®</sup> I/O Controller Hub (ICHx) specification [9] requires support for five more audio rates (8, 11.025, 16, 22.05, and 32 kHz). The CS4201 supports all these rates, as shown in Table 8 on page 31.

#### 2.4 Mixers

The CS4201 input and output mixers are illustrated in Figure 8. The stereo input mixer sums together the analog inputs to the CS4201 according to the settings in the volume control registers. The stereo output mixer sums the output of the stereo input mixer with the PC\_BEEP and PHONE signals. After going through the 3D output mixer, the stereo output mix is then sent to the LINE\_OUT and HP\_OUT pins of the CS4201. The mono output mixer generates a monophonic sum of the left and right audio channels from the stereo input mixer. The mono output mix is then sent to the MONO\_OUT pin on the CS4201.

### 2.5 Input Mux

The input multiplexer controls which analog input is sent to the ADCs. The output of the input mux is converted to stereo 18-bit digital PCM data and transmitted to the controller by means of the AC-link SDATA\_IN signal.

#### 2.6 Volume Control

The CS4201 volume registers control analog input levels to the input mixer and analog output levels, including the master volume level. The PC\_BEEP volume control uses 3 dB steps with a range of 0 dB to -45 dB attenuation. All other analog volume controls use 1.5 dB steps. The analog inputs have a mixing range of +12 dB signal gain to -34.5 dB signal attenuation. The analog output volume controls have from 0 dB to -46.5 dB attenuation for LINE\_OUT, HP\_OUT, and MONO\_OUT.

Figure 8. CS4201 Mixer Diagram

#### 3. AC-LINK FRAME DEFINITION

The AC-link is a bi-directional serial port with data organized into frames consisting of one 16-bit and twelve 20-bit time-division multiplexed slots. Slot 0 is a special reserved time slot containing 16-bits which are used for AC-link protocol infrastructure. Slots 1 through 12 contain audio or control/status data. Both the serial data output and input frames are defined from the controller perspective, not from the CS4201 perspective.

The controller synchronizes the beginning of a frame with the assertion of the SYNC signal. Figure 9 shows the position of each bit location

within the frame. The first bit position in a new serial data frame is F0 and the last bit position in the serial data frame is F255. When SYNC goes active (high) and is sampled active by the CS4201 (on the falling edge of BIT\_CLK), both devices are synchronized to a new serial data frame. The data on the SDATA\_OUT pin at this clock edge is the final bit of the previous frame's serial data. On the next rising edge of BIT\_CLK, the first bit of Slot 0 is driven by the controller on the SDATA\_OUT pin. On the next falling edge of BIT\_CLK, the CS4201 latches this data in as the first bit of the frame.

Figure 9. AC-link Input and Output Framing

#### 3.1 AC-Link Serial Data Output Frame

In the serial data output frame, data is passed on the SDATA\_OUT pin to the CS4201 from the AC '97 controller. Figure 9 illustrates the serial port timing.

The PCM playback data being passed to the CS4201 is shifted out MSB first in the most significant bits of each slot. Any PCM data from the AC '97 controller that is not 20 bits wide should be left justified in its corresponding slot and dithered or zero-padded in the unused bit positions.

Bits that are reserved should always be 'cleared' by the AC '97 controller.

#### 3.1.1 Serial Data Output Slot Tags (Slot 0)

| Bit 15    | 14   | 13     | 12                       | 11                             | 10                | 9                              | 8                  | 7                | 6                 | 5                     | 4                   | 3   | 2                | 1                   | 0              |

#### 3.1.2 Command Address Port (Slot 1)

| Bit 19 | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11 | 10 | 9 | 8 | 7 | 6    | 5     | 4 | 3 | 2 | 1 | 0 |
|--------|-----|-----|-----|-----|-----|-----|-----|----|----|---|---|---|------|-------|---|---|---|---|---|
| R/W    | RI6 | RI5 | RI4 | RI3 | RI2 | RI1 | RI0 |    |    |   |   |   | Rese | erved |   |   |   |   |   |

| R/W     | Read/Write. When this bit is 'set', a read of the AC '97 register specified by the register index bits will occur in the AC '97 2.x audio codec. When the bit is 'cleared', a write will occur. For any read or write access to occur, the Valid Frame bit (F0) must be 'set' and the Codec ID[1:0] bits (F[14:15]) must match the Codec ID of the AC '97 2.x audio codec being accessed. Additionally, for a primary codec, the Slot 1 Valid bit (F1) must be 'set' for a read access and both the Slot 1 Valid bit (F1) and the Slot 2 Valid bit (F2) must be 'set' for a write access. For a secondary codec, both the Slot 1 Valid bit (F1) and the Slot 2 Valid bit (F2) must be 'cleared' for read and write accesses. See Figure 9 for bit frame positions. |
|---------|--|
| RI[6:0] | Register Index. The RI[6:0] bits contain the 7-bit register index to the AC '97 registers in the CS4201. All registers are defined at word addressable boundaries. The RI0 bit must be 'clear' to access CS4201 registers.   |

#### 3.1.3 Command Data Port (Slot 2)

| Bit 19 | 18   | 17   | 16   | 15   | 14   | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3 | 2    | 1     | 0 |
|--------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|------|-------|---|
| WD15   | ND14 | WD13 | WD12 | WD11 | WD10 | WD9 | WD8 | WD7 | WD6 | WD5 | WD4 | WD3 | WD2 | WD1 | WD0 |   | Rese | ervec | ł |

- WD[15:0] Write Data. The WD[15:0] bits contain the 16-bit value to be written to the register. If an access is a read, this slot is ignored.
- NOTE: For any write to an AC '97 register, the write is defined to be an 'atomic' access. This means that when the Slot 1 Valid bit in output Slot 0 is 'set', the Slot 2 Valid bit in output Slot 0 should always be 'set' during the same audio frame. No write access may be split across 2 frames.
- 3.1.4 PCM Playback Data (Slots 3-11)

| Bit 19 | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|--------|------|------|------|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| PD19   | PD18 | PD17 | PD16 | PD15 | PD14 | PD13 | PD12 | PD11 | PD10 | PD9 | PD8 | PD7 | PD6 | PD5 | PD4 | PD3 | PD2 | PD1 | PD0 |

PD[19:0] Playback Data. The PD[19:0] bits contain the 20-bit PCM (2's complement) playback data for the left and right DACs, serial data ports, and/or the S/PDIF transmitter. Table 10 on page 35 lists a cross reference for each function and its respective slot. The mapping of a given slot to the DAC, serial data port, or S/PDIF transmitter is determined by the state of the ID[1:0] bits in the *Extended Audio ID Register (Index 28h)* and by the SM[1:0] and AMAP bits in the *AC Mode Control Register (Index 5Eh)*.

3.1.5 GPIO Pin Control (Slot12)

| Bit 19 | 18 | 17 | 16 | 15 | 14 | 13     | 12    | 11    | 10 | 9 | 8 | 7 | 6 | 5     | 4     | 3 | 2    | 1     | 0 |
|--------|----|----|----|----|----|--------|-------|-------|----|---|---|---|---|-------|-------|---|------|-------|---|
|        |    |    |    |    | I  | Not Im | pleme | ented |    |   |   |   |   | GPIO1 | GPIO0 |   | Rese | erved |   |

GPIO[1:0] GPIO Pin Control. The GPIO[1:0] bits control the CS4201 GPIO pins configured as outputs. Write accesses using GPIO pin control bits configured at outputs will be reflected on the GPIO pin output on the next AC-link frame. Write accesses using GPIO pin control bits configured as inputs will have no effect and are ignored. If the GPOC bit in the *Misc. Crystal Control Register (Index 60h)* is 'set', the bits in output Slot 12 are ignored and GPIO pins configured as outputs are controlled through the *GPIO Pin Status Register (Index 54h)*.

#### 3.2 AC-Link Serial Data Input Frame

In the serial data input frame, data is passed on the SDATA\_IN pin from the CS4201 to the AC '97 controller. The data format for the input frame is very similar to the output frame. Figure 9 on page 16 illustrates the serial port timing.

The PCM capture data from the CS4201 is shifted out MSB first in the most significant 18 bits of each slot. The least significant 2 bits in each slot will be 'cleared'. If the host requests PCM data from the AC '97 Controller that is less than 18 bits wide, the controller should dither and round or just round (but not truncate) to the desired bit depth.

Bits that are reserved or not implemented in the CS4201 will always be returned 'cleared'.

3.2.1 Serial Data Input Slot Tag Bits (Slot 0)

| Bit 15 | 14     | 13     | 12     | 11     | 10     | 9      | 8      | 7      | 6 | 5 | 4 | 3       | 2 | 1         | 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|---|---|---|---------|---|-----------|---|
| Codec  | Slot 1 | Slot 2 | Slot 3 | Slot 4 | Slot 5 | Slot 6 | Slot 7 | Slot 8 | 0 | 0 | 0 | Slot 12 |   | Reserved  |   |
| Ready  | Valid  | U | v | Ŭ | Valid   |   | 110001100 |   |

- Codec Ready Codec Ready. The Codec Ready bit indicates the readiness of the CS4201 AC-link. Immediately after a Cold Reset this bit will be 'clear'. Once the CS4201 clocks and voltages are stable, this bit will be 'set'. Until the Codec Ready bit is 'set', no AC-link transactions should be attempted by the controller. The Codec Ready bit does not indicate readiness of the DACs, ADCs, Vref, or any other analog function. Those must be checked in the *Powerdown Control/Status Register (Index 26h)* by the controller before any access is made to the mixer registers. Any accesses to the CS4201 while Codec Ready is 'clear' are ignored.
- Slot 1 Valid The Slot 1 Valid bit indicates Slot 1 contains a valid read back address.
- Slot 2 Valid The Slot 2 Valid bit indicates Slot 2 contains valid register read data.
- Slot [3:8] Valid The Slot [3:8] Valid bits indicate Slot [3:8] contains valid capture data from the CS4201 ADCs. If a bit is 'set', the corresponding input slot contains valid data. If a bit is 'cleared', the corresponding slot will be ignored.

Slot 12 Valid The Slot 12 Valid bit indicates Slot 12 contains valid GPIO status data.

3.2.2 Status Address Port (Slot 1)

| Bit 19 | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4 | 3    | 2 | 1    | 0     |
|--------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|------|---|------|-------|
| Res    | RI6 | RI5 | RI4 | RI3 | RI2 | RI1 | RI0 | SR3 | SR4 | SR5 | SR6 | SR7 | SR8 | SR9 | 0 | SR11 | 0 | Rese | erved |

- RI[6:0] Register Index. The RI[6:0] bits echo the AC '97 register address when a register read has been requested in the previous frame. The CS4201 will only echo the register index for a read access. Write accesses will not return valid data in Slot 1.
- SR[3:9,11] Slot Request. If SRx is 'set', this indicates the CS4201 SRC does not need a new sample on the next AC-link frame for that particular slot. If SRx is 'clear', the SRC indicates a new sample is needed on the following frame. If the VRA bit in the *Extended Audio Status/Control Register* (*Index 2Ah*) is 'clear', the SR[3:9,11] bits are always 0. When VRA is 'set', the SRC is enabled and the SR[3:9,11] bits are used to request data.

#### 3.2.3 Status Data Port (Slot 2)

| Bit 19 | 18   | 17     | 16   | 15   | 14   | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3 | 2    | 1     | 0 |
|--------|------|--------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|------|-------|---|
| RD15   | RD14 | 4 RD13 | RD12 | RD11 | RD10 | RD9 | RD8 | RD7 | RD6 | RD5 | RD4 | RD3 | RD2 | RD1 | RD0 |   | Rese | erved |   |

RD[15:0] Read Data. The RD[15:0] bits contain the register data requested by the controller from the previous read request. All read requests will return the read address in the input Slot 1 and the register data in the input Slot 2 on the following serial data frame.

3.2.4 PCM Capture Data (Slot 3-8)

| Bit 19 | 9 18   | 17     | 16   | 15   | 14   | 13   | 12   | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1 | 0 |
|--------|--------|--------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|---|
| CD17   | ' CD16 | 6 CD15 | CD14 | CD13 | CD12 | CD11 | CD10 | CD9 | CD8 | CD7 | CD6 | CD5 | CD4 | CD3 | CD2 | CD1 | CD0 | 0 | 0 |

CD[17:0] Capture Data. The CD [17:0] bits contain 18-bit PCM (2's complement) capture data. The data will only be valid when the respective slot valid bit is 'set' in input Slot 0. The mapping of a given slot to an ADC is determined by the state of the ID[1:0] bits in the *Extended Audio ID Register (Index 28h)* and the SM[1:0] and AMAP bits in the *AC Mode Control Register (Index 5Eh)*. The definition of each slot can be found in Table 10 on page 35.

3.2.5 GPIO Pin Status (Slot 12)

| Bit | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5     | 4     | 3 | 2      | 1  | 0            |
|-----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|-------|-------|---|--------|----|--------------|
| 0   | )  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | GPIO1 | GPIO0 | R | eserve | ed | GPIO<br>_INT |

GPIO[1:0] GPIO Pin Status. The GPIO[1:0] bits reflect the status of the CS4201 GPIO pins configured as inputs. The pin status of GPIO pins configured as outputs will be reflected back on the GPIO[1:0] bits of input Slot 12 in the next frame. The output GPIO pins are controlled by the GPIO[1:0] pin control bits in output Slot 12.

GPIO\_INT GPIO Interrupt. The GPIO\_INT bit indicates that a GPIO interrupt event has occurred. The occurrence of a GPIO interrupt is determined by the GPIO interrupt requirements as outlined in the *GPIO Pin Wakeup Mask Register (Index 52h)* description. In this case, the GPIO\_INT bit is cleared by writing a '0' to the bit in the *GPIO Pin Status Register (Index 54h)* corresponding to the GPIO pin which generated the interrupt.

# 3.3 AC-Link Protocol Violation - Loss of SYNC

The CS4201 is designed to handle SYNC protocol violations. The following are situations where the SYNC protocol has been violated:

- The SYNC signal is not sampled high for exactly 16 BIT\_CLK clock cycles at the start of an audio frame.
- The SYNC signal is not sampled high on the 256th BIT\_CLK clock period after the previous SYNC assertion.

• The SYNC signal goes active high before the 256th BIT\_CLK clock period after the previous SYNC assertion.

Upon loss of synchronization with the controller, the CS4201 will mute all analog outputs and 'clear' the Codec Ready bit in the serial data input frame until two valid frames are detected. During this detection period, the CS4201 will ignore all register reads and writes and will discontinue the transmission of PCM capture data.

## 4. REGISTER INTERFACE

| Reg   | Register Name          | D15    | D14  | D13        | D12  | D11  | D10  | D9   | D8   | D7   | D6   | D5         | D4    | D3   | D2   | D1     | D0   | Default |

 Table 1. Register Overview for the CS4201

#### 4.1 Reset Register (Index 00h)

| D15    | D14 | D13 | D12   | D11  | D10     | D9     | D8        | D7        | D6       | D5       | D4      | D3      | D2    | D1 | D0 |  |  |
|--------|-----|-----|---|--|---------|--------|-----------|-----------|----------|----------|---------|---------|-------|----|----|--|--|
| 0      | SE4 | SE3 | SE2   | SE1  | SE0     | 0      | ID8       | ID7       | 0        | 0        | ID4     | 0       | 0     | 0  | 0  |  |  |
| SE[4:0 | ]   |     | Crysta  | Crystal 3D Stereo Enhancement. SE[4:0] = 00110, indicating this feature is present.  |         |        |           |           |          |          |         |         |       |    |    |  |  |
| ID8    |     |     | 18-bit  | 8-bit ADC Resolution. The ID8 bit is 'set', indicating this feature is present.  |         |        |           |           |          |          |         |         |       |    |    |  |  |
| ID7    |     |     | 20-bit  | DAC re   | solutio | n. The | ID7 bit i | is 'set', | indicati | ing this | feature | is pres | sent. |    |    |  |  |
| ID4    |     |     | •   | Headphone Out. The ID4 bit is 'set', indicating this feature is present. The state of this bit de-<br>pends on the state of the HPCFG pin. |         |        |           |           |          |          |         |         |       |    |    |  |  |
| Defaul | t   |     | h. The data in this register is read-only data. |  |         |        |           |           |          |          |         |         |       |    |    |  |  |

Any write to this register causes a Register Reset of the audio control (*Index 00h - 3Ah*) and Cirrus Logic defined (*Index 5Ah - 7Ah*) registers. A read from this register returns configuration information about the CS4201.

| 4.2 | Analog Mixer | Output Vol                | lume Registers | (Index 02h - 04h) |

| Mute | Output Mute. Setting this bit mutes the LINE_OUT_L/R or HP_OUT_L/R output signals. |
|------|--|
|------|--|

- ML[5:0] Output Volume Left. These bits control the left master output volume. Each step corresponds to 1.5 dB gain adjustment, with a total available range from 0 dB to -46.5 dB attenuation. Setting the <u>ML5</u> bit sets the left channel attenuation to -46.5 dB by forcing ML[4:0] to a '1' state. ML[5:0] will read back 011111 when <u>ML5</u> has been 'set'. See Table 2 for further details.
- MR[5:0] Output Volume Right. These bits control the right master output volume. Each step corresponds to 1.5 dB gain adjustment, with a total available range from 0 dB to -46.5 dB attenuation. Setting the <u>MR5</u> bit sets the right channel attenuation to -46.5 dB by forcing MR[4:0] to a '1' state. MR[5:0] will read back 011111 when <u>MR5</u> has been 'set'. See Table 2 for further details.

Default 8000h. This value corresponds to 0 dB attenuation and Mute 'set'.

If the HPCFG pin is left floating, register 02h controls the Master Output Volume and register 04h controls the Headphone Output Volume. If the HPCFG pin is tied 'low', register 02h controls the Headphone Volume and register 04h is a read-only register and always returns 0000h when 'read'.

Mute Phone Mute. Setting this bit mutes the Phone input signal.

GN[5:0] Phone Volume Control. The GN[4:0] bits control the gain level of the Phone input source to the Input Mixer. Each step corresponds to 1.5 dB gain adjustment, with 01000 = 0 dB. The total range is +12 dB to -34.5 dB attenuation. See Table 4 on page 26 for further attenuation levels.

Default 8008h. This value corresponds to 0 dB attenuation and Mute 'set'.

# 4.6 Microphone Volume Register (Index 0Eh)

| 4.11    | 3D C | ontrol | Registe  | er (Ind  | ex 22h | )   |    |                     |    |    |    |    |    |    |          |  |  |
| D15     | D14  | D13    | D12  | D11  | D10    | D9  | D8 | D7                  | D6 | D5 | D4 | D3 | D2 | D1 | D0       |  |  |
| 0       | 0    | 0      | 0  | 0  | 0      | 0   | 0  | 0                   | 0  | 0  | 0  | S3 | S2 | S1 | S0       |  |  |

S[3:0]Spatial Enhancement Depth Control. The S[3:0] spatial enhancement bits are enabled by the<br/>3D bit in the General Purpose Register (Index 20h). When S[3:0] = 0000, minimum spatial<br/>enhancement is added. When S[3:0] = 1111, maximum spatial enhancement is added.

Default 0000h. This value corresponds to minimum spatial enhancement.

#### 4.12 Powerdown Control/Status Register (Index 26h)

| D15 D14 D13  | D12 D11 D10 D9 D8 D7 D6 D5 D4 D3 D2 D1 D0   |  |  |  |  |  |  |  |  |  |  |  |  |
|--------------|---|--|--|--|--|--|--|--|--|--|--|--|--|
| EAPD PR6 PR5 | PR4 PR3 PR2 PR1 PR0 0 0 0 0 REF ANL DAC ADC   |  |  |  |  |  |  |  |  |  |  |  |  |
| EAPD         | External Amplifier Power Down. The EAPD pin follows this bit and is generally used to power down external amplifiers. The EAPD bit is mutually exclusive with the SDSC bit in the <i>Serial Port Control Register (Index 6Ah)</i> . The SDSC bit must be 'clear' before the EAPD bit may be set'. If the SDSC bit is 'set', EAPD is a read-only bit and always returns '0'. |  |  |  |  |  |  |  |  |  |  |  |  |
| PR6          | Headphone Amplifier Powerdown. When 'set', the headphone amplifier is powered dow   |  |  |  |  |  |  |  |  |  |  |  |  |
| PR5          | nternal Clock Disable. When 'set', the internal master clock is disabled (BIT_CLK running)<br>The only way to recover from setting this bit is through a Cold Reset (driving the RESET# signal active).   |  |  |  |  |  |  |  |  |  |  |  |  |
| PR4          | AC-link Powerdown. When 'set', the AC-link is powered down (BIT_CLK off). The AC-link can be restarted through a Warm Reset using the SYNC signal, or a Cold Reset using the RE-SET# signal (primary audio codec only).   |  |  |  |  |  |  |  |  |  |  |  |  |
| PR3          | Analog Mixer Powerdown (Vref off). When 'set', the analog mixer and voltage reference are powered down. When clearing this bit, the ANL, ADC, and DAC bits should be checked before writing any mixer registers.  |  |  |  |  |  |  |  |  |  |  |  |  |
| PR2          | Analog Mixer Powerdown (Vref on). When 'set', the analog mixer is powered down (the volt-<br>age reference is still active). When clearing this bit, the ANL bit should be checked before writ-<br>ing any mixer registers.   |  |  |  |  |  |  |  |  |  |  |  |  |
| PR1          | Front DACs Powerdown. When 'set', the DACs are powered down. When clearing this bit, the DAC bit should be checked before sending any data to the DACs.   |  |  |  |  |  |  |  |  |  |  |  |  |
| PR0          | L/R ADCs and Input Mux Powerdown. When 'set', the ADCs and the ADC input muxes are powered down. When clearing this bit, no valid data will be sent down the AC-link until the ADC bit goes high.   |  |  |  |  |  |  |  |  |  |  |  |  |
| REF          | Voltage Reference Ready Status. When 'set', the REF bit indicates the voltage reference is at a nominal level.  |  |  |  |  |  |  |  |  |  |  |  |  |
| ANL          | Analog Ready Status. When 'set', the analog output mixer, input multiplexer, and volume con-<br>trols are ready. When 'clear', no volume control registers should be written.   |  |  |  |  |  |  |  |  |  |  |  |  |
| DAC          | Front DAC Ready Status. When 'set', the DACs are ready to receive data across the AC-link.<br>When 'clear', the DACs will not accept any valid data.  |  |  |  |  |  |  |  |  |  |  |  |  |
| ADC          | L/R ADCs Ready Status. When 'set', the ADCs are ready to send data across the AC-link. When 'clear', no data will be sent to the controller.  |  |  |  |  |  |  |  |  |  |  |  |  |
| Default      | 0000h. This value indicates all blocks are powered on. The lower four bits will change as the CS4201 finishes an initialization and calibration sequence.   |  |  |  |  |  |  |  |  |  |  |  |  |

The PR[6:0] and the EAPD bits are powerdown control for different sections of the CS4201 as well as external amplifiers. The REF, ANL, DAC, and ADC bits are read-only status bits which, when 'set', indicate that a particular section of the CS4201 is ready. After the controller receives the Codec Ready bit in input Slot 0, these status bits must be checked before writing to any mixer registers. See Section 8, *Power Management*, for more information on the powerdown functions.

#### 4.13 Extended Audio ID Register (Index 28h)

| D15     | D14   | D13  | D12   | D11    | D10    | D9                   | D8      | D7      | D6       | D5                | D4      | D3       | D2      | D1 | D0       |
|---------|-------|--|---|--------|--------|----------------------|---------|---------|----------|-------------------|---------|----------|---------|----|----------|
| ID1     | ID0   | 0  | 0   | 0      | 0      | AMAP                 | 0       | 0       | 0        | 0                 | 0       | 0        | 0       | 0  | VRA      |
| ID[1:0] |       | Codec Configuration ID. These bits indicate the current codec configuration. When $ID[1:0] = 00$ , the CS4201 is the primary audio codec. When $ID[1:0] = 01$ , 10, or 11, the CS4201 is a secondary audio codec. The state of the $ID[1:0]$ bits is determined at power-u from the $ID[1:0]$ # pins and the current clocking scheme, see Table 17 on page 49. |   |        |        |                      |         |         |          |                   |         |          |         |    |          |
| AMAP    |       |  | Audio Slot Mapping. The AMAP bit indicates whether the optional AC '97 2.1 compliant AC-link slot to audio DAC mapping is supported. This bit is a shadow of the AMAP bit in the AC Mode Control Register (Index 5Eh). The PCM playback and capture slots are mapped ac cording to Table 10 on page 35. |        |        |                      |         |         |          |                   |         |          |         |    |          |

VRA

Default 0000h

#### 4.15 Audio Sample Rate Control Registers (Index 2Ch - 32h)

| D15  | D14  | D13  | D12  | D11  | D10  | D9  | D8  | D7  | D6  | D5  | D4  | D3  | D2  | D1  | D0  |
|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| SR15 | SR14 | SR13 | SR12 | SR11 | SR10 | SR9 | SR8 | SR7 | SR6 | SR5 | SR4 | SR3 | SR2 | SR1 | SR0 |

SR[15:0] Sample Rate Select. The Audio Sample Rate Control Registers (Index 2Ch - 32h) control playback and capture sample rates. The PCM Front DAC Rate Register (Index 2Ch) controls the Front Left and Front Right DAC sample rates. The PCM L/R ADC Rate Register (Index 32h) controls the Left and Right ADC sample rates. There are seven sample rates directly supported by this register, shown in Table 8. Any value written to this register not contained inTable 8 is not directly supported and will be decoded according to the ranges indicated in the table. The range boundaries have been chosen so that only bits SR[15:12] of each register will have to be considered. All register read transactions will reflect the actual value stored (column 2 in Table 8) and not the one attempted to be written.

Default BB80h. This value corresponds to 48 kHz sample rate.

Writes to the *PCM Front DAC Rate Register (Index 2Ch)* and the *PCM L/R ADC Rate Register (Index 32h)* are only available in Variable Rate PCM Audio mode when the VRA bit in the *Extended Audio Status/Control Register (Index 2Ah)* is 'set'. If VRA = 0, writes to the register are ignored and the register will always read BB80h.

| Sample Rate<br>(Hz) | SR[15:0], register content (hex value) | SR[15:0], decode range (hex value) | SR[15:12], decode<br>range (bin value) |
|---------------------|--|------------------------------------|--|

| 48,000              | BB80                                   | B000 - FFFF                        | 1011 - 1111                            |

Table 8. Directly Supported SRC Sample Rates for the CS4201

#### 4.16 Extended Modem ID Register (Index 3Ch)

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| ID1 | ID0 | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

ID[1:0]Codec Configuration ID. Primary is 00; Secondary is 01,10,or 11. This is a reflection of the<br/>ID[1:0]# configuration pins. The state of the ID[1:0] bits is determined at power-up from the<br/>Codec ID[1:0]# pins and the current clocking scheme, see Table 17 on page 49.

Default x000h. This value indicates no supported modem functions.

The *Extended Modem ID Register (Index 3Ch)* is a read/write register that identifies the CS4201 modem capabilities. Writing any value to this location issues a reset to modem registers *(Index 3Ch-54h)*, including GPIO registers *(Index 4Ch - 54h)*. Audio registers are not reset by a write to this location.

4.17 Extended Modem Status/Control Register (Index 3Eh)

| D15 | D14 | D13 | D12  | D11     | D10      | D9     | D8                    | D7     | D6     | D5       | D4      | D3      | D2        | D1     | D0    |
|-----|-----|-----|------|---------|----------|--------|-----------------------|--------|--------|----------|---------|---------|-----------|--------|-------|
| 0   | 0   | 0   | 0    | 0       | 0        | 0      | PRA                   | 0      | 0      | 0        | 0       | 0       | 0         | 0      | GPIO  |
| PRA |     |     | GPIO | sectior | n is pow | ered d | set', the<br>own, all | output | s must | be tri-s | tated a | nd inpu | it Slot 1 | 2 shou | ld be |

marked invalid when the AC-link is active. To use any GPIO functionality PRA must be cleared first. The Serial Data mode and the GPIO mode of operation are mutually exclusive. To use any GPIO function, SDEN of the *Serial Port Control Register (Index 6Ah)* must be 'clear' prior to clearing PRA. If the SDEN bit is 'set', PRA is a read-only bit and always returns '1'.

GPIO GPIO. When 'set', the GPIO bit indicates the GPIO subsystem is ready for use. When 'set', input Slot 12 will also be marked valid.

Default 0100h

4.18 GPIO Pin Configuration Register (Index 4Ch)

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1  | D0  |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|-----|-----|
| 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | GC1 | GC0 |

GC[1:0] GPIO Pin Configuration. When 'set', the GC[1:0] bits define the corresponding GPIO pin as an input. When 'clear', the corresponding GPIO pin is defined as an output.

Default 0003h. This value corresponds to all GPIO pins configured as inputs.

After a Cold Reset or a modem Register Reset (see *Extended Modem ID Register (Index 3Ch)*), all GPIO pins are configured as inputs. The upper 14 bits of this register always return '0'.

| 4.19 | GPIO Pin | Polarity/Type    | Configuration | Register | (Index 4Eh) |
|------|----------|------------------|---------------|----------|-------------|
| 1.1/ | 0110111  | 1 Oldinity 1 ypc | congration    | negisier |             |

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1  | D0  |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|-----|-----|
| 1   | 1   | 1   | 1   | 1   | 1   | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | GP1 | GP0 |

GP[1:0]GPIO Pin Configuration. This register defines the GPIO input polarity (0 = Active Low,<br/>1 = Active High) when a GPIO pin is configured as an input. The GP[1:0] bits define the GPIO<br/>output type (0 = CMOS, 1 = OPEN-DRAIN) when a GPIO pin is configured as an output. The<br/>GC[1:0] bits in the GPIO Pin Configuration Register (Index 4Ch) define the GPIO pins as in-<br/>puts or outputs. See Table 9 for the various GPIO configurations.

Default FFFh

After a Cold Reset or a modem Register Reset this register defaults to all 1's. The upper 14 bits of this register always return '1'.

| GCx | GPx | Function | Configuration         |
|-----|-----|----------|-----------------------|
| 0   | 0   | Output   | CMOS Drive            |
| 0   | 1   | Output   | Open Drain            |
| 1   | 0   | Input    | Active Low            |
| 1   | 1   | Input    | Active High (default) |

Table 9. GPIO Input/Output Configurations

4.20 GPIO Pin Sticky Register (Index 50h)

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1  | D0  |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|-----|-----|
| 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | GS1 | GS0 |

GS[1:0] GPIO Pin Sticky. This register defines the GPIO input type (0 = not sticky, 1 = sticky) when a GPIO pin is configured as an input. The GPIO pin status of an input configured as "sticky" is 'cleared' by writing a '0' to the corresponding bit of the *GPIO Pin Status Register (Index 54h)*, and by reset.

Default 0000h

After a Cold Reset or a modem Register Reset this register defaults to all 0's, specifying "non-sticky". "Sticky" is defined as edge sensitive, "non-sticky" as level sensitive. The upper 14 bits of this register always return '0'.

#### 4.21 GPIO Pin Wakeup Mask Register (Index 52h)

| 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | GW1 | GW0 |

GW[1:0] GPIO Pin Wakeup. This register provides a mask for determining if an input GPIO change will generate a wakeup event (0 = No, 1 = yes). When the AC-link is powered up, a wakeup event will be communicated through the assertion of GPIO\_INT = 1 in input Slot 12. When the AC-link is powered down (*Powerdown Control/Status Register (Index 26h)* bit PR4 = 1 for primary codecs), a wakeup event will be communicated through a '0' to '1' transition on SDATA\_IN.

Default 0000h

GPIO bits which have been programmed as inputs, "sticky", and "wakeup", upon transition either (high-to-low) or (low-to-high) depending on pin polarity, will cause an AC-link wakeup if and only if the AC-link was powered down. Once the controller has re-established communication with the CS4201 following a Warm Reset, it will continue to signal the wakeup event through the GPIO\_INT bit of input Slot 12 until the AC '97 controller clears the interrupt-causing bit in the *GPIO Pin Status Register (Index 54h)*; or the "wakeup", config, or "sticky" status of that GPIO pin changes.

After a Cold Reset or a modem Register Reset (see *Extended Modem ID Register (Index 3Ch)*) this register defaults to all 0's, specifying no wakeup event. The upper 14 bits of this register always return '0'.

4.22 GPIO Pin Status Register (Index 54h)

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1  | D0  |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|-----|-----|
| 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | GI1 | GI0 |

GI[1:0] GPIO Pin Status. This register reflects the state of all GPIO pin inputs and outputs. These values are also reflected in Slot 12 of every SDATA\_IN frame. GPIO inputs configured as "sticky" are 'cleared' by writing a '0' to the corresponding bit of this register. The GPIO\_INT bit in input Slot 12 is 'cleared' by clearing all interrupt-causing bits in this register.

Default 0000h

GPIO pins which have been programmed as inputs and "sticky", upon transition either high-to-low or low-to-high depending on pin polarity, will cause the individual GI bit to be 'set', and remain 'set' until 'cleared'. GPIO pins which have been programmed as outputs are controlled either through output Slot 12 or through this register, depending on the state of the GPOC bit in the *Misc. Crystal Control Register (Index 60h)*. If the GPOC bit is 'cleared', the GI bits in this register are read-only and reflect the status of the corresponding GPIO output pin 'set' through output slot 12. If the GPOC bit is 'set', the GI bits in this register are read/write bits and control the corresponding GPIO output pins.

The default value is always the state of the GPIO pin. The upper 14 bits of this register should be forced to zero in this register and input Slot 12.

| D15 D   | 014 | D13 | D12                                | D11  | D10                 | D9      | D8        | D7                      | D6      | D5        | D4        | D3        | D2       | D1                                | D0       |
|---------|-----|-----|------------------------------------|--|---------------------|---------|-----------|-------------------------|---------|-----------|-----------|-----------|----------|-----------------------------------|----------|
| SPEN \  | Val | 0   | Fs                                 | L  | CC6                 | CC5     | CC4       | CC3                     | CC2     | CC1       | CC0       | Emph      | Сору     | /Audio                            | Pro      |
| SPEN    |     |     | The S<br>put to<br>throug<br>dex 5 | S/PDIF Enable. The SPEN bit enables S/PDIF data transmission on the SPDO/SDO2 pin. The SPEN bit routes the left and right channel data from the AC '97 controller or the ADC output to the S/PDIF transmitter block. The actual data routed to the S/PDIF block is controlled hrough the ASPM/AMAP/SM[1:0]/SPAS configuration in the <i>AC Mode Control Register (Index 5Eh)</i> . This bit can only be 'set' if the SDO2 bit in the <i>Serial Port Control Register (Index 6Ah)</i> is '0'. If the SDO2 bit is 'set', SPEN is a read-only bit and always returns '0'. |                     |         |           |                         |         |           |           |           |          |                                   |          |
| Val     |     |     |                                    | alidity. The Val bit is mapped to the V bit (bit 28) of every <i>sub-frame</i> . If this bit is 'clear', the ignal is suitable for conversion or processing.   |                     |         |           |                         |         |           |           |           |          | ar', the                          |          |
| Fs      |     |     | bit is r<br>freque<br>S/PDI        | Sample Rate. The Fs bit indicates the sampling rate for the S/PDIF data. The inverse of this bit is mapped to bit 25 of the channel status block. When the Fs bit is 'clear', the sampling frequency is 48 kHz. When 'set', the sampling frequency is 44.1 kHz. The actual rate at whic S/PDIF data are being transmitted solely depends on the master clock frequency of the CS4201. The Fs bit is merely an indicator to the S/PDIF receiver.  |                     |         |           |                         |         |           |           |           |          | oling<br>which                    |          |

| T[7:0]  |            |        |                   | Third Character of Vendor ID. With a value of $T[7:0] = 59h$ , these bits define the ASCII 'Y' character.  |         |    |    |    |      |      |      |    |      |          |      |
| DID[2:0 | <b>)</b> ] |        | Devic             | Device ID. With a value of DID[2:0] = 100, these bits specify the audio codec is a CS4201.                 |         |    |    |    |      |      |      |    |      |          |      |

REV[2:0] Revision. With a value of REV[2:0] = 001, these bits specify the audio codec revision is 'A'.

Default 594xh. This register contains read-only data.

The two Vendor ID registers provide a means to determine the manufacturer of the AC '97 audio codec. The first three bytes of the Vendor ID registers contain the ASCII code for the first three letters of Crystal (CRY). The final byte of the Vendor ID registers is divided into a Device ID field and a Revision field. Table 12 lists the currently defined Device ID's.

| DID2-DID0 | Part Name     |
|-----------|---------------|
| 000       | CS4297        |
| 001       | CS4297A       |
| 010       | CS4294/CS4298 |
| 011       | CS4299        |
| 100       | CS4201        |
| 101       | CS4205        |
| 110       | CS4291        |

Table 12. Device ID with Corresponding Part Number

## 5. SERIAL DATA PORTS

### 5.1 Overview

The CS4201 implements two serial data output ports that can be used for multi-channel expansion. Each serial port consists of 4 signals: MCLK, SCLK, LRCLK, and SDATA. The existing 256 Fs BIT\_CLK will be used as MCLK. The clock pins are shared between all the serial ports with only the SDATA pins being separate; SDOUT for the first output port, and SDO2 for the second output port. Serial data is transmitted on these ports every AC-link frame.

The serial data port is controlled by the SDEN, SDSC, and SDO2 bits in the *Serial Port Control Register (Index 6Ah)*. All the serial data port pins are multiplexed with other functions and cannot be used unless the other function is disabled or powered down; see Section 7, *Exclusive Functions*. Some audio DACs can run in an internal SCLK mode where SCLK is internally derived from MCLK and LRCLK. In this case, SCLK generation in the CS4201 is optional.

A feature has been designed into the CS4201 that allows the phase of the internal DACs to be reversed. This DAC phase reversal is controlled by the DPC bit in the *Misc. Crystal Control Register*  (Index 60h). This feature is necessary since the phase response for external DACs is unknown and the phase response of the internal DACs can vary depending on the path determined by the POP bit in the General Purpose Register (Index 20h), the DDM bit in the AC Mode Control Register (Index 5Eh), and the output (LINE\_OUT or HP\_OUT) being used. This feature guarantees that all DACs in a system have the same phase response, maintaining the accuracy of spatial cues.

Please note the data sent to the serial ports is straight from the AC-link. There is no SRC and no volume control available on this data, so it is the responsibility of the controller or host software to provide this functionality if desired.

### 5.2 Multi-Channel Expansion

For multi-channel expansion, the two serial data output ports are used to send AC-link data to one or two external stereo DACs to support up to a total of six channels. The first serial port takes the digital audio data from the SDOUT slots. The second serial port takes the digital audio data from the SDO2 slots. See Table 10 on page 35 for the actual slots used depending on configuration. Figure 10 shows a six channel application using the CS4201.

Figure 10. Serial Data Port: Six Channel Circuit

### **5.3** Serial Data Formats

In order to support a wide variety of serial audio DACs, the CS4201 can transmit serial data in four different formats. The desired format is selected through the SDF[1:0] bits in the *Serial Port Control Register (Index 6Ah)*. All serial ports use the same serial data format when enabled. In all cases, LRCLK will be synchronous with Fs, and SCLK

will be 64 Fs (BIT\_CLK/4). Serial data is transitioned by the CS4201 on the falling edge of SCLK and latched by the DACs on the next rising edge. Serial data is shifted out MSB first in all supported formats, but LRCLK polarity as well as data justification, alignment, and resolution vary. Table 13 shows the principal characteristics of each serial format.

| SDF[1:0] | LRCLK<br>Polarity | Data<br>Justification | Data Alignment<br>(MSB vs. LRCLK) | Data<br>Resolution | Timing<br>Diagram | Recommended<br>DAC |
|----------|-------------------|-----------------------|-----------------------------------|--------------------|-------------------|--------------------|
| 0 0      | negative          | left justified        | 1 SCLK delayed                    | 20-bit             | Figure 11         | CS4334             |
| 01       | positive          | left justified        | not delayed                       | 20-bit             | Figure 12         | CS4335             |
| 10       | positive          | right justified       | not delayed                       | 20-bit             | Figure 13         | CS4337             |
| 11       | positive          | right justified       | not delayed                       | 16-bit             | Figure 14         | CS4338             |

Table 13. Serial Data Formats and Compatible DACs for the CS4201

Figure 13. Serial Data Format 2 (Right Justified, 20-bit data)

Figure 14. Serial Data Format 3 (Right Justified, 16-bit data)

## 6. SONY/PHILIPS DIGITAL INTERFACE (S/PDIF)

The S/PDIF digital output is used to interface the CS4201 to consumer audio equipment external to the PC. This output provides an interface for storing digital audio data or playing digital audio data to digital speakers. Figure 15 illustrates the circuits

necessary for implementing the IEC-958 optical or consumer interface. For further information on S/PDIF operation see application note AN22: Overview of Digital Audio Interface Data Structures [3]. For further information on S/PDIF recommended transformers see application note AN134: AES and S/PDIF Recommended Transformers [4].

Figure 15. S/PDIF Output

## 7. EXCLUSIVE FUNCTIONS

Some of the digital pins on the CS4201 have multiplexed functionality. These functions are mutually exclusive and cannot be requested at the same time. The following pairs of functions are mutually exclusive:

- GPIO and Serial Data Port (GPIO0 pin is shared with LRCLK pin and GPIO1 pin is shared with SDOUT pin)
- EAPD and Serial Data Port Serial Clock (EAPD pin is shared with SCLK pin)
- S/PDIF and Second Serial Data Port (SPDO pin is shared with SDO2 pin)

There is no priority assigned to the exclusive functions. A function currently in use must be disabled or powered down before the corresponding exclusive function can be enabled. The following control bits for these functions will behave differently than normal bits: the EAPD bit in the Powerdown Control/Status Register (Index 26h), the PRA bit in the Extended Modem Status/Control Register (Index 3Eh), the SPEN bit in the S/PDIF Control Register (Index 68h), and the SDEN, SDO2, and SDSC bits in the Serial Port Control Register (Index 6Ah). These bits can become read-only bits if they control a feature that is currently unavailable because the corresponding exclusive feature is already in use, or the corresponding master control for this feature is not set.

## 8. POWER MANAGEMENT

### 8.1 AC '97 Reset Modes

The CS4201 supports four reset methods, as defined in the AC '97 Specification: *Cold Reset*, *Warm Reset, New Warm Reset*, and *Register Reset*. A Cold Reset results in all AC '97 logic (registers included) initialized to its default state. A Warm Reset or New Warm Reset leaves the contents of the AC '97 register set unaltered. A Register Reset initializes only the AC '97 registers to their default states.

### 8.1.1 Cold Reset

A Cold Reset is achieved by asserting RESET# for a minimum of 1  $\mu$ s after the power supply rails have stabilized. This is done in accordance with the minimum timing specifications in the *AC* '97 Serial Port Timing section on page 10. Once de-asserted, all of the CS4201 registers will be reset to their default power-on states and the BIT\_CLK and SDATA\_IN signals will be reactivated.

### 8.1.2 Warm Reset

A Warm Reset allows the AC-link to be reactivated without losing information in the CS4201 registers. A Warm Reset is required to resume from a  $D3_{hot}$  state where the AC-link had been halted yet full power had been maintained. A primary codec Warm Reset is initiated when the SYNC signal is driven high for at least 1 µs and then driven low in the absence of the BIT\_CLK clock signal. The BIT\_CLK clock will not restart until at least 2 nor-

mal BIT\_CLK clock periods (162.8 ns) after the SYNC signal is de-asserted. A Warm Reset of the secondary codec is recognized when the primary codec on the AC-link resumes BIT\_CLK generation. The CS4201 will wait for BIT\_CLK to be stable to restore SDATA\_IN activity, S/PDIF and/or serial data port transmission on the following frame.

### 8.1.3 New Warm Reset

The New Warm Reset also allows the AC-link to be reactivated without losing information in the registers. A New Warm Reset is required to resume from a  $D3_{cold}$  state where AC-link power has been removed. New Warm Reset is recognized by the low-high transition of RESET# after the AC-link has been programmed into PR4 powerdown. The New Warm Reset functionality can be disabled by setting the CRST bit in the *Misc. Crystal Control Register (Index 60h)*.

### 8.1.4 Register Reset

The last reset mode provides a Register Reset to the CS4201. This is available only when the CS4201 AC-link is active and the Codec Ready bit is 'set'. The audio (including extended audio) control registers (*Index 00h - 3Ah*) and the vendor specific registers (*Index 5Ah - 7Ah*) are reset to their default states by a write of any value to the *Reset Register* (*Index 00h*). The modem (including GPIO) registers (*Index 3Ch - 56h*) are reset to their default states by a write of any value to the *Extended Modem ID Register* (*Index 3Ch*).

### 8.2 Powerdown Controls

The *Powerdown Control/Status Register* (*Index 26h*) controls the power management functions. The PR[6:0] bits in this register control the internal powerdown states of the CS4201. Powerdown control is available for individual subsections of the CS4201 by asserting any PRx bit or any combination of PRx bits. All powerdown states except PR4 and PR5 can be resumed by clearing the corresponding PRx bit. Table 14 shows the mapping of the power control bits to the functions they manage.

When PR0 is 'set', the L/R ADCs and the Input Mux are shut down and the ADC bit in the *Powerdown Control/Status Register (Index 26h)* is 'cleared' indicating the ADCs are no longer in a ready state. The same is true for PR1 and the DACs, PR2 and the analog mixer, PR3 and the voltage reference (Vrefout), and PR6 and the headphone amplifier. When one of these bits is 'cleared', the corresponding subsystem will begin a power-on process, and the associated status bit will be 'set' when the hardware is ready.

In a primary codec the PR4 bit powers down the AC-link, but all other analog and digital sub-

systems continue to function. The required resume sequence from a PR4 state is either a Warm Reset or a New Warm Reset, depending on whether a  $D3_{hot}$  or  $D3_{cold}$  state has been entered.

The PR5 bit disables all internal clocks and powers down the DACs and the ADCs, but maintains operation of the BIT\_CLK and the analog mixer. A Cold Reset is the only way to restore operation to the CS4201 after asserting PR5. To achieve a complete digital powerdown, PR4 and PR5 must be asserted within a single AC output frame. This will also drive BIT\_CLK 'low'.

The CS4201 does not automatically mute any input or output when the powerdown bits are 'set'. The software driver controlling the AC '97 device must manage muting the input and output analog signals before putting the part into any power management state. The definition of each PRx bit may affect a single subsection or a combination of subsections within the CS4201. Table 15 contains the matrix of subsections affected by the respective PRx function. Table 16 shows the different operating power consumptions levels for different powerdown functions.

| PR Bit | Function                          |
|--------|-----------------------------------|
| PR0    | L/R ADCs and Input Mux Powerdown  |
| PR1    | Front DACs Powerdown              |
| PR2    | Analog Mixer Powerdown (Vref on)  |
| PR3    | Analog Mixer Powerdown (Vref off) |
| PR4    | AC-link Powerdown (BIT_CLK off)*  |
| PR5    | Internal Clock Disable            |
| PR6    | Headphone Out Powerdown           |

\* Applies only to primary codec

**Table 14. Powerdown PR Bit Functions** 

| PR Bit | ADCs | DACs | Mixer | Analog<br>Reference | AC<br>Link | Internal<br>Clock Off | Headphone |
|--------|------|------|-------|---------------------|------------|-----------------------|-----------|
| PR0    | •    |      |       |                     |            |                       |           |
| PR1    |      | •    |       |                     |            |                       |           |
| PR2    | •    | •    | •     |                     |            |                       | •         |

<sup>1</sup> Assuming standard resistive load for transformer coupled coaxial S/PDIF output (Rload = 292 Ohm, DVdd = 3.3 V) (Rload = 415 Ohm, DVdd = 5 V). General:  $I_{DVdd S/PDIF} = I_{DVdd} + DVdd/Rload/2$ 

<sup>2</sup> HP\_OUT\_L, HP\_OUT\_R driving 4 Vpp into 32 Ohm resistive load.

## 9. CLOCKING

The CS4201 may be operated as a primary or secondary codec. As a primary codec, the system clock for the AC-link may be generated from an external 24.576 MHz clock source, a 24.576 MHz crystal, or use the internal Phase Locked Loop (PLL). The PLL allows the CS4201 to accept external clock frequencies other than 24.576 MHz. The CS4201 uses the presence or absence of a valid clock on the XTL\_IN pin in conjunction with the ID[1:0]# pins to determine the clocking configuration.

### 9.1 PLL Operation (External Clock)

The PLL mode is activated if a valid clock is present on XTL\_IN during the rising edge of RESET#. Once PLL mode is entered, the XTL OUT pin is redefined as the PLL loop filter, as shown in Figure 16. The ID[1:0]# inputs determine the configuration of the internal divider ratios required to generate the 12.288 MHz BIT CLK output; see Table 17 on page 49 for additional details. In PLL mode, the CS4201 is configured as a primary codec independent of the state of the ID[1:0]# pins. If 24.576 MHz is chosen as the external clock input (ID[1:0]# inputs both pulled high or left floating), the PLL is disabled and the clock is used directly. The loop filter is not required and XTL OUT is left unconnected. For all other clock input choices, the loop filter is required. The ID[1:0] bits of the Extended Audio ID Register (Index 28h) and the Extended Modem ID Register (Index 3Ch) will always report 0 in PLL mode.

### 9.2 24.576 MHz Crystal Operation

If a valid clock is not present on XTL\_IN during the rising edge of RESET#, the device disables the PLL input and latches the state of the ID[1:0]# inputs. If the ID[1:0]# inputs are both pulled high or left floating, the device is configured as a primary codec. An external 24.576 MHz crystal is used as the system clock as shown in Figure 17.

### 9.3 Secondary Codec Operation

If a valid clock is not present on XTL\_IN and either ID[1:0]# input is pulled low during the rising edge of RESET#, the device is determined to be a secondary codec. The BIT\_CLK pin is configured as an input and the CS4201 is driven from the 12.288 MHz BIT\_CLK of the primary codec. The ID[1:0] bits of the *Extended Audio ID Register* (*Index 28h*) and the *Extended Modem ID Register* (*Index 3Ch*) will report the state of the ID[1:0]# inputs.

 Table 17. Clocking Configurations for the CS4201

## 10. ANALOG HARDWARE DESCRIPTION

The analog input section consists of four stereo line-level inputs (LINE\_L/R, CD\_L/GND/R, VIDEO\_L/R, and AUX\_L/R), two selectable mono microphone inputs (MIC1 and MIC2), and two mono inputs (PC BEEP and PHONE). The analog output section consists of a mono output (MONO OUT), a stereo headphone output (HP OUT L/R), and a stereo line-level output (LINE OUT L/R). This section describes the analog hardware needed to interface with these pins. The designs presented in this section are compliant with Chapter 17 of Microsoft's® PC 99 System Design Guide [7] (referred to as PC 99) and Chapter 11 of Microsoft's<sup>®</sup> PC 2001 System Design Guide [8] (referred to as PC 2001). For information on EMI reduction techniques refer to the application note AN165: CS4297A/CS4299 EMI Reduction Techniques [5].

# **10.1 Analog Inputs**

All analog inputs to the CS4201, including CD\_GND, should be capacitively coupled to the input pins. Unused analog inputs should be tied together and connected through a capacitor to analog ground or tied to the Vrefout pin directly. The maximum allowed voltage for analog inputs, except the microphone input, is 1  $V_{RMS}$ . The maximum allowed voltage for the microphone input depends on the selected boost setting.

# 10.1.1 Line Inputs

Figure 18 shows circuitry for a line-level stereo input. Replicate this circuit for the Line, Video and Aux inputs. This design attenuates the input by 6 dB, bringing the signal from the PC 99 specified 2  $V_{RMS}$ , to the CS4201 maximum allowed 1  $V_{RMS}$ .

# 10.1.2 CD Input

The CD line-level input has an extra pin, CD\_GND, providing a pseudo-differential input

for both CD\_L and CD\_R. This pin takes the common-mode noise out of the CD inputs when connected to the CD analog source ground. Following the reference designs in Figure 19 and Figure 20 provides extra attenuation of common mode noise coming from the CD-ROM drive, thereby producing a higher quality signal. One percent resistors are recommended since closely matched resistor values provide better common-mode attenuation of unwanted signals. The circuit shown in Figure 19 can be used to attenuate a 2  $V_{RMS}$  CD input signal by 6 dB. The circuit shown in Figure 20 can be used for a 1  $V_{RMS}$  CD input signal.

Figure 18. Line Input (Replicate for Video and AUX)

Figure 19. Differential 2  $V_{RMS}\ CD$  Input

Figure 20. Differential 1  $V_{RMS}$  CD Input

### 10.1.3 Microphone Inputs

Figure 21 illustrates an input circuit suitable for dynamic and electret microphones. Electret, also known as phantom-powered, microphones use the right channel (ring) of the jack for power. The design also supports the recommended advanced frequency response for voice recognition as specified in PC 99 and PC 2001. The microphone input of the CS4201 has an integrated pre-amplifier. Using combinations of the 10dB bit in the *Misc. Crystal Control Register (Index 60)* and the 20dB bit in the *Mic Volume Register (Index 0Eh)* the pre-amplifier gain can be set to 0 dB, 10 dB, 20 dB, or 30 dB.

### 10.1.4 PC Beep Input

The PC\_BEEP input is useful for mixing the output of the "beeper" (timer chip), provided in most PCs, with the other audio signals. When the CS4201 is held in reset, PC\_BEEP is passed directly to the line output. This allows the system sounds or "beeps" to be available before the AC '97 interface has been activated. Figure 22 illustrates a typical input circuit for the PC\_BEEP input. If PC\_BEEP is driven from a CMOS gate, the 4.7 k $\Omega$  resistor should be tied to analog ground instead of +5VA. Although this input is described for a low-quality

Figure 21. Microphone Input

"beeper", it is of the same high-quality as all other analog inputs and may be used for other purposes.

### 10.1.5 Phone Input

One application of the PHONE input is to interface to the output of a modem analog front end (AFE) device so that modem dialing signals and protocol negotiations may be monitored through the audio system. Figure 23 shows a design for a modem connection where the output is fed from the CS4201 MONO\_OUT pin through a divider. The divider ratio shown does not attenuate the signal, providing an output voltage of 1 V<sub>RMS</sub>. If a lower output voltage is desired, the resistors can be replaced with appropriate values, as long as the total load on the output is kept greater than 10 k $\Omega$ . The PHONE input is divided by 6 dB to accommodate a line-level source of 2 V<sub>RMS</sub>.

Figure 22. PC\_BEEP Input

Figure 23. Modem Connection

## **10.2 Analog Outputs**

The analog output section provides a stereo, a headphone, and a mono output. The MONO\_OUT, LINE\_OUT\_L, and LINE\_OUT\_R pins require 680 pF to 1000 pF NPO dielectric capacitors between the corresponding pin and analog ground. Each analog output is DC-biased up to the Vrefout voltage signal reference, nominally 2.4 V. This requires the outputs be AC-coupled to external circuitry (AC loads must be greater than 10 k $\Omega$  for the line output or 32  $\Omega$  for the headphone output). The headphone coupling capacitors should be 220  $\mu$ F or greater to minimize low frequency roll-off.

### 10.2.1 Stereo Outputs

The LINE\_OUT and HP\_OUT stereo outputs depend on the configuration of the HPCFG pin. As shown in Figure 24, if the HPCFG pin is left floating, the part behaves as specified in AC '97. As shown in Figure 25, if the HPCFG pin is grounded, the part behaves as if HP\_OUT was the only output. In this case, LINE\_OUT will be muted, the *Master Volume Register (Index 02h)* will control HP\_OUT and PC\_BEEP will be routed to HP\_OUT during RESET.

## 10.2.2 Mono Output

The mono output, MONO\_OUT, can be either a sum of the left and right output channels, attenuated by 6 dB to prevent clipping at full scale, or the selected Mic signal. The mono out channel can drive the PC internal mono speaker using an appropriate buffer circuit

### 10.3 Miscellaneous Analog Signals

The AFLT1 and AFLT2 pins must have a 1000 pF NPO capacitor to analog ground. These capacitors provide a single-pole low-pass filter at the inputs to the ADCs. This makes low-pass filters at each analog input pin unnecessary.

The REFFLT pin must have a short, wide trace to a 2.2  $\mu$ F and a 0.1  $\mu$ F capacitor connected to analog ground (see Figure 27 in Section 11, *Grounding and Layout*, for an example). The 2.2  $\mu$ F capacitor must not be replaced by any other value and must be ceramic with low leakage current. Electrolytic capacitors should not be used. No other connection should be made, as any coupling onto this pin will degrade the analog performance of the CS4201. Likewise, digital signals should be kept away from REFFLT for similar reasons.

Figure 24. Line Out and Headphone Out Setup

### 10.4 Power Supplies

The power supplies providing analog power should be as clean as possible to minimize coupling into the analog section which could degrade analog performance. One analog power pin, AVdd2, supplies power to the headphone amplifier on the CS4201. The other analog power pin, AVdd1, supplies power to the rest of the CS4201 analog circuitry. The +5 V analog supply should be generated from a voltage regulator (7805 type) connected to a +12 V supply. This helps isolate the analog circuitry from noise typically found on +5 V digital supplies. A typical voltage regulator circuit for analog power using a MC78M05CDT +5V regulator is shown in Figure 26. The digital power pins, DVdd1 and DVdd2, should be connected to the same digital supply as the controller's AC-link interface. Since

the digital interface on the CS4201 may operate at either +3.3 V or +5 V, proper connection of these pins will depend on the digital power supply of the controller.

### **10.5** Reference Design

See Section 14 for a CS4201 reference design.

Figure 26. +5V Analog Voltage Regulator

## **11. GROUNDING AND LAYOUT**

Figure 27 shows the conceptual layout for the CS4201 in XTAL or OSC clocking modes. The decoupling capacitors should be located physically as close to the pins as possible. Also, note the connection of the REFFLT decoupling capacitors to the ground return trace connected directly to the ground return pin, AVss1.

It is strongly recommended that separate analog and digital ground planes be used. Separate ground planes keep digital noise and return currents from modulating the CS4201 ground potential and degrading performance. The digital ground pins should be connected to the digital ground plane and kept separate from the analog ground connections of the CS4201 and any other external analog circuitry. All analog components and traces should be located over the analog ground plane and all digital components and traces should be located over the digital ground plane.

The common connection point between the two ground planes (required to maintain a common ground voltage potential) should be located under the CS4201. The AC-link digital interface connection traces should be routed such that the digital ground plane lies underneath these signals (on the internal ground layer). This applies along the entire length of these traces from the AC '97 controller to the CS4201.

Refer to the Application Note AN18: Layout and Design Rules for Data Converters and Other Mixed Signal Devices [2] for more information on layout and design rules.

Figure 27. Conceptual Layout for the CS4201 when in XTAL or OSC Clocking Modes

# **12. PIN DESCRIPTIONS**

Figure 28. Pin Locations for the CS4201

CS4201

### Audio I/O Pins

#### PC\_BEEP - Analog Mono Source, Input, Pin 12

The PC\_BEEP input is intended to allow the PC system POST (Power On Self-Test) tones to pass through to the audio subsystem. The PC\_BEEP input has two connections: the first connection is to the analog output mixer, the second connection is directly to the LINE\_OUT stereo outputs (if HPCFG is floating) or through the headphone amplifier to the HP\_OUT pins (if HPCFG is tied low). While the RESET# pin is actively being asserted to the CS4201, the PC\_BEEP bypass path to the LINE\_OUT outputs is enabled. While the CS4201 is in normal operation mode with RESET# de-asserted, PC\_BEEP is a monophonic source to the analog output mixer. The maximum allowable input is 1 V<sub>RMS</sub> (sinusoidal). This input is internally biased at the Vrefout voltage reference and requires AC-coupling to external circuitry. If this input is not used, it should be connected to the Vrefout pin or AC-coupled to analog ground.

#### PHONE - Analog Mono Source, Input, Pin 13

This analog input is a monophonic source to the output mixer. It is intended to be used as a modem subsystem input to the audio subsystem. The maximum allowable input is 1  $V_{RMS}$  (sinusoidal). This input is internally biased at the Vrefout voltage reference and requires AC-coupling to external circuitry. If this input is not used, it should be connected to the Vrefout pin or AC-coupled to analog ground.

#### MIC1 - Analog Mono Source, Input, Pin 21

This analog input is a monophonic source to the analog output mixer. It is intended to be used as a desktop microphone connection to the audio subsystem. The CS4201 internal mixer's microphone input is MUX selectable with either MIC1 or MIC2 as the input. The maximum allowable input is 1  $V_{RMS}$  (sinusoidal). This input is internally biased at the Vrefout voltage reference and requires AC-coupling to external circuitry. If this input is not used, it should be connected to the Vrefout pin or AC-coupled to analog ground.

#### MIC2 - Analog Mono Source, Input, Pin 22

This analog input is a monophonic source to the analog output mixer. It is intended to be used as an alternate microphone connection to the audio subsystem. The CS4201 internal mixer's microphone input is MUX selectable with either MIC1 or MIC2 as the input. The maximum allowable input is 1  $V_{RMS}$  (sinusoidal). This input is internally biased at the Vrefout voltage reference and requires AC-coupling to external circuitry. If this input is not used, it should be connected to the Vrefout pin or AC-coupled to analog ground.

#### LINE\_IN\_L, LINE\_IN\_R - Analog Line Source, Inputs, Pins 23 and 24

These inputs form a stereo input pair to the CS4201. The maximum allowable input is  $1 V_{RMS}$  (sinusoidal). These inputs are internally biased at the Vrefout voltage reference and require AC-coupling to external circuitry. If these inputs are not used, they should both be connected to the Vrefout pin or AC-coupled to analog ground.

#### CD\_L, CD\_R - Analog CD Source, Inputs, Pins 18 and 20

These inputs form a stereo input pair to the CS4201. It is intended to be used for the Red Book CD audio connection to the audio subsystem. The maximum allowable input is 1  $V_{RMS}$  (sinusoidal). These inputs are internally biased at the Vrefout voltage reference and require AC-coupling to external circuitry. If these inputs are not used, they should both be connected to the Vrefout pin or AC-coupled to analog ground.

#### CD\_GND - Analog CD Common Source, Input, Pin 19

This analog input is used to remove common mode noise from Red Book CD audio signals. The impedance on the input signal path should be one half the impedance on the CD\_L and CD\_R input paths. This pin requires AC-coupling to external circuitry. If this input is not used, it should be connected to the Vrefout pin or AC-coupled to analog ground.

CS4201

#### VIDEO\_L, VIDEO\_R - Analog Video Audio Source, Inputs, Pins 16 and 17

These inputs form a stereo input pair to the CS4201. It is intended to be used for the audio signal output of a video device. The maximum allowable input is  $1 V_{RMS}$  (sinusoidal). These inputs are internally biased at the Vrefout voltage reference and require AC-coupling to external circuitry. If these inputs are not used, they should both be connected to the Vrefout pin or AC-coupled to analog ground.

#### AUX\_L, AUX\_R - Analog Auxiliary Source, Inputs, Pins 14 and 15

These inputs form a stereo input pair to the CS4201. The maximum allowable input is  $1 V_{RMS}$  (sinusoidal). These inputs are internally biased at the Vrefout voltage reference and require AC-coupling to external circuitry. If these inputs are not used, they should both be connected to the Vrefout pin or AC-coupled to analog ground.

#### LINE\_OUT\_L, LINE\_OUT\_R - Analog Line-Level, Outputs, Pins 35 and 36

These signals are analog outputs from the stereo output mixer. The full-scale output voltage for each output is nominally  $1 V_{RMS}$  (sinusoidal). These outputs are internally biased at the Vrefout voltage reference and require either AC-coupling to external circuitry or DC-coupling to a buffer op-amp biased at the Vrefout voltage. These pins need a 680-1000 pF NPO capacitor attached to analog ground.

#### HP\_OUT\_L, HP\_OUT\_R - Analog Headphone, Outputs, Pins 39 and 41

These signals are analog outputs from the stereo output mixer. The full-scale output voltage for each output is nominally  $4 V_{pp}$ . These outputs are internally biased at the Vrefout voltage reference and require AC-coupling to external circuitry. The HP\_OUT pins can directly drive resistive loads as low as 32  $\Omega$  (such as standard consumer headphones). Capacitive loading must not exceed 200 pF per pin. The outputs are short circuit protected for infinite duration.

#### HP\_OUT\_C - Analog Headphone Output Common Source, Input, Pin 40

This analog input is used to remove common mode noise from the headphone outputs. This is achieved by biasing the headphone amplifier with the common mode noise on the headphone amplifier ground plane. This pin should be AC-coupled through a 1  $\mu$ F electrolytic capacitor to analog ground (AVss2) near the headphone jack.

#### MONO\_OUT - Analog Mono Line-Level, Output, Pin 37

This signal is an analog output from the stereo-to-mono mixer. The full-scale output voltage for this output is nominally 1  $V_{RMS}$  (sinusoidal). This output is internally biased at the Vrefout voltage reference and requires either AC-coupling to external circuitry or DC-coupling to a buffer op-amp biased at the Vrefout voltage. This pin needs a 680-1000 pF NPO capacitor attached to analog ground.

#### Analog Reference, Filter, and Configuration Pins

#### **REFFLT - Internal Reference Voltage, Input, Pin 27**

This signal is the voltage reference used internal to the CS4201. A 0.1  $\mu$ F and a 2.2  $\mu$ F ceramic capacitor with short, wide traces must be connected to this pin. No other connections should be made to this pin. Do not use an electrolytic 2.2  $\mu$ F capacitor, use a type Z5U or Y5V ceramic capacitor.

#### Vrefout - Voltage Reference, Output, Pin 28

All analog inputs and outputs are centered around Vrefout, nominally 2.4 Volts. This pin may be used to bias external amplifiers. It can also drive up to 5 mA of DC which can be used for microphone bias.

#### AFLT1 - Left ADC Channel Antialiasing Filter, Input, Pin 29

This pin needs a 1000 pF NPO capacitor connected to analog ground.

#### AFLT2 - Right ADC Channel Antialiasing Filter, Input, Pin 30

This pin needs a 1000 pF NPO capacitor connected to analog ground.

#### FLTI, FLTO - Filter Input/Filter Output, Pins 33 and 34

A 1000 pF capacitor must be attached between FLTI and FLTO if the 3D function is used.

#### FLT3D - 3D Filter, Pin 32

A 0.01  $\mu$ F X7R capacitor must be attached from this pin to AGND if the 3D function is used.

#### HPCFG - Headphone Configuration, Input, Pin 31

This pin is the configuration control for the signal routing to the headphone amplifier. If this pin is left floating, the LINE\_OUT and HP\_OUT pins function as defined in the AC '97 specification. If the HPCFG pin is grounded, the HP\_OUT pins behave as a buffered line output. In addition, the LINE\_OUT pins are muted, the control register for the headphone output will be the *Master Output Volume Register (Index 02h)*, and PC\_BEEP is routed to the HP\_OUT pins during RESET. The HPCFG pin is internally pulled up to the analog supply voltage.

#### AC-Link Pins

#### RESET# - AC '97 Chip Reset, Input, Pin 11

This active low signal is the asynchronous Cold Reset input to the CS4201. The CS4201 must be reset before it can enter normal operating mode.

#### SYNC - AC-Link Serial Port Sync pulse, Input, Pin 10

SYNC is the serial port timing signal for the AC-link. Its period is the reciprocal of the maximum sample rate, 48 kHz. The signal is generated by the controller and is synchronous to BIT\_CLK. SYNC is an asynchronous input when the CS4201 is configured as a primary codec and is in a PR4 powerdown state. A series terminating resistor of 47  $\Omega$  should be connected on this signal close to the controller.

#### BIT\_CLK - AC-Link Serial Port Master Clock, Input/Output, Pin 6

This input/output signal controls the master clock timing for the AC-link. In primary mode, this signal is a 12.288 MHz output clock derived from either a 24.576 MHz crystal or from the internal PLL based on the XTL\_IN input clock. When the CS4201 is in secondary mode, this signal is an input which controls the AC-link serial interface and generates all internal clocking including the AC-link serial interface timing and the analog sampling clocks. A series terminating resistor of 47  $\Omega$  should be connected on this signal close to the CS4201 in primary mode or close to the BIT\_CLK source in secondary mode.

#### SDATA\_OUT - AC-Link Serial Data Input Stream to AC '97, Input, Pin 5

This input signal receives the control information and digital audio output streams. The data is clocked into the CS4201 on the falling edge of BIT\_CLK. A series terminating resistor of 47  $\Omega$  should be connected on this signal close to the controller.

#### SDATA\_IN - AC-Link Serial Data Output Stream from AC '97, Output, Pin 8

This output signal transmits the status information and digital audio input streams from the ADCs. The data is clocked out of the CS4201 on the rising edge of BIT\_CLK. A series terminating resistor of 47  $\Omega$  should be connected on this signal close to the CS4201.

CS4201

### Clock and Configuration Pins

#### XTL\_IN - Crystal Input/Clock Input, Pin 2

This pin requires either a 24.576 MHz crystal, with the other pin attached to XTL\_OUT, or an external CMOS clock. XTL\_IN must have a crystal or clock source attached for proper operation except when operating in secondary codec mode. The crystal frequency must be 24.576 MHz and designed for fundamental mode, parallel resonance operation. If an external CMOS clock is used to drive this pin, it must run at one of these acceptable frequencies: 14.31818. 24.576, 27, or 48 MHz. When configured as a secondary codec, all timing is derived from the BIT\_CLK input signal and this pin should be left floating. See Section 9, *Clocking*, for additional details.

#### XTL\_OUT - Crystal Output/ PLL Loop Filter, Pin 3

This pin is used for a crystal placed between this pin and XLT\_IN. If an external 24.576 MHz clock is used on XTL\_IN, this pin must be left floating with no traces or components connected to it. If one of the other acceptable clocks is used on XTL\_IN, this pin must be connected to a loop filter circuit. See Section 9, *Clocking*, for additional details.

#### ID1#, ID0# - Codec ID, Inputs, Pins 45 and 46

These pins select the Codec ID for the CS4201, as well as determine the rate of the incoming clock in PLL mode. They are only sampled after the rising edge of RESET#. These pins are internally pulled up to the digital supply voltage and should be left floating for logic '0' or tied to digital ground for logic '1'.

#### Misc. Digital Interface Pins

#### SPDO/SDO2 - Sony/Philips Digital Interface / Serial Data Output 2, Output, Pin 48

This pin generates the S/PDIF digital output from the CS4201 when the SPEN bit in the S/PDIF Control Register (Index 68h) is 'set'. This output may be used to directly drive a resistive divider and coupling transformer to an RCA-type connector for use with consumer audio equipment. This pin also provides the serial data for the second serial data port when the SDO2 bit in the Serial Port Control Register (Index 6Ah) is 'set'. These two functions are mutually exclusive. When neither function is being used this output is driven to a logic '0'.

#### EAPD/SCLK - External Amplifier Powerdown / Serial Clock, Output, Pin 47

This pin is used to control the powerdown state of an audio amplifier external to the CS4201. The output is controlled by the EAPD bit in the *Powerdown Ctrl/Stat Register (Index 26h)*. It is driven as a normal CMOS output and defaults low ('0') upon power-up. This pin also provides the serial clock for both serial data ports when the SDSC bit in the *Serial Port Control Register (Index 6Ah)* is 'set'.

#### GPIO0/LRCLK - General Purpose I/O / Left-Right Clock, Input/Output, Pin 43

This pin is a general purpose I/O pin that can be used to interface with various external circuitry. When configured as an input, it functions as a Schmitt triggered input with 350 mV hysteresis at 5 V and 220 mV hysteresis at 3.3 V. When configured as an output, it can function as a normal CMOS output (4 mA drive) or as an open drain output. This pin also provides the L/R clock for both serial data ports when the SDEN bit in the *Serial Port Control Register (Index 6Ah)* is 'set'. This bit powers up in the high impedance state for backward compatibility.

#### GPIO1/SDOUT - General Purpose I/O / Serial Data Ouput, Input/Output, Pin 44

This pin is a general purpose I/O pin that can be used to interface with various external circuitry. When configured as an input, it functions as a Schmitt triggered input with 350 mV hysteresis at 5 V and 220 mV hysteresis at 3.3 V. When configured as an output, it can function as a normal CMOS output (4 mA drive) or as an open drain output. This pin also provides the serial data for the first serial data port when the SDEN bit in the *Serial Port Control Register (Index 6Ah)* is 'set'. This bit powers up in the high impedance state for backward compatibility.

#### Power Supply Pins

#### DVdd1, DVdd2 - Digital Supply Voltage, Pins 1 and 9

Digital supply voltage for the AC-link section of the CS4201. These pins can be tied to +5 V digital or to +3.3 V digital. The CS4201 and controller's AC-link should share a common digital supply.

#### DVss1, DVss2 - Digital Ground, Pins 4 and 7

Digital ground connection for the AC-link section of the CS4201. These pins should be isolated from analog ground currents.

#### AVdd1, AVdd2 - Analog Supply Voltage, Pins 25 and 38

Analog supply voltage for the analog and mixed signal section of the CS4201 (AVdd1) as well as the headphone amplifier (AVdd2). These pins must be tied to the analog +5 V power supply. It is strongly recommended that +5 V be generated from a voltage regulator to ensure proper supply currents and noise immunity from the rest of the system.

#### AVss1, AVss2 - Analog Ground, Pins 26 and 42

Ground connection for the analog, mixed signal, and substrate sections of the CS4201 (AVss1) as well as the headphone amplifier (AVss2). These pins should be isolated from digital ground currents.

### **13. PARAMETER AND TERM DEFINITIONS**

#### AC '97 Specification

Refers to the Audio Codec '97 Component Specification Ver 2.1 published by the Intel® Corporation [6].

#### AC '97 Controller or Controller

Refers to the control chip which interfaces to the audio codec AC-link. This has been also called *DC '97* for Digital Controller '97 [6].

#### AC '97 Registers or Codec Registers

Refers to the 64-field register map defined in the AC '97 Specification.

#### ADC

Refers to a single Analog-to-Digital converter in the CS4201. "ADCs" refers to the stereo pair of Analog-to-Digital converters. The CS4201 ADCs have 18-bit resolution.

#### Codec

Refers to the chip containing the ADCs, DACs, and analog mixer. In this data sheet, the codec is the CS4201.

#### DAC

Refers to a single Digital-to-Analog converter in the CS4201. "DACs" refers to the stereo pair of Digital-to-Analog converters. The CS4201 DACs have 20-bit resolution.

#### dB FS A

dB FS is defined as dB relative to full-scale. The "A" indicates an A weighting filter was used.

#### **Differential Nonlinearity**

The worst case deviation from the ideal code width. Units in LSB.

#### Dynamic Range (DR)

DR is the ratio of the RMS full-scale signal level divided by the RMS sum of the noise floor, in the presence of a signal, available at any instant in time (no change in gain settings between measurements). Measured over a 20 Hz to 20 kHz bandwidth with units in dB FS A.

#### FFT

Fast Fourier Transform.

#### Frequency Response (FR)

FR is the deviation in signal level verses frequency. The 0 dB reference point is 1 kHz. The amplitude corner, Ac, lists the maximum deviation in amplitude above and below the 1 kHz reference point. The listed minimum and maximum frequencies are guaranteed to be within the Ac from minimum frequency to maximum frequency inclusive.

#### Fs

Sampling Frequency.

#### **Interchannel Gain Mismatch**

For the ADCs, the difference in input voltage to get an equal code on both channels. For the DACs, the difference in output voltages for each channel when both channels are fed the same code. Units are in dB.

#### Interchannel Isolation

The amount of 1 kHz signal present on the output of the grounded AC-coupled line input channel with 1 kHz, 0 dB, signal present on the other line input channel. Units are in dB.

#### Line-level

Refers to a consumer equipment compatible, voltage driven interface. The term implies a low driver impedance and a minimum 10 k $\Omega$  load impedance.

#### PATHS

A-D: Analog in, through the ADCs, onto the serial link.

D-A: Serial interface inputs through the DACs to the analog output.

A-A: Analog in to Analog out (analog mixer).

#### PC 99

Refers to the PC 99 System Design Guide published by the Microsoft® Corporation [7].

#### PC 2001

Refers to the PC 2001 System Design Guide published by the Microsoft® Corporation [8].

#### PLL

Phase Lock Loop. Circuitry for generating a desired clock from an external clock source.

#### Resolution

The number of bits in the output words to the DACs, and in the input words to the ADCs.

### Signal to Noise Ratio (SNR)

SNR, similar to DR, is the ratio of an arbitrary sinusoidal input signal to the RMS sum of the noise floor, in the presence of a signal. It is measured over a 20 Hz to 20 kHz bandwidth with units in dB.

#### S/PDIF

Sony/Phillips Digital Interface. This interface was established as a means of digitally interconnecting consumer audio equipment. The documentation for S/PDIF has been superseded by the IEC-958 consumer digital interface document.

#### SRC

Sample Rate Converter. Converts data derived at one sample rate to a differing sample rate. The CS4201 operates at a fixed sample frequency of 48 kHz. The internal sample rate converters are used to convert digital audio streams playing back at other frequencies to 48 kHz.

#### Total Harmonic Distortion plus Noise (THD+N)

THD+N is the ratio of the RMS sum of all non-fundamental frequency components, divided by the RMS full-scale signal level. It is tested using a -3 dB FS input signal and is measured over a 20 Hz to 20 kHz bandwidth with units in dB FS.
