

**Product Features**

- 10 MHz to 134 MHz operating range
- Zero input-output propagation delay, adjustable by external capacitive load on FBK input
- Multiple configurations, see “Available PI6C2308 Configurations” table
- Input to output delay, less than 200ps
- Multiple low skew outputs
  - Output-output skew less than 200ps
  - Device-device skew less than 600ps
  - Two banks of four outputs, Hi-Z by two select inputs
- Low Jitter, less than 200ps
- 3.3V operation
- Space-saving Packages:
  - 16-pin, 150-mil SOIC package (W16) (-1, -1H, -2, -3, -4, -6)
  - 16-pin TSSOP package (L16) (-1, -1H)
- Available in industrial and commercial temperatures

**Block Diagrams**

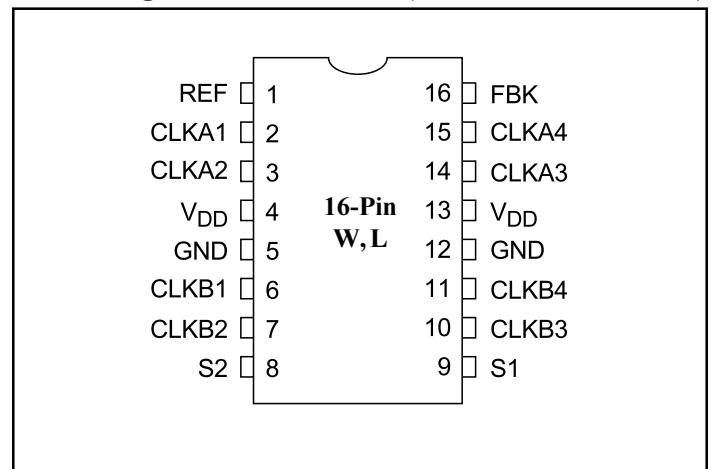

**Functional Description**

Providing two banks of four outputs, the PI6C2308 is a 3.3V zero-delay buffer designed to distribute clock signals in applications including PC, workstation, datacom, telecom, and high-performance systems. Each bank of four outputs can be controlled by the select inputs as shown in the Select Input Decoding Table.

The PI6C2308 provides 8 copies of a clock signal that has 200ps phase error compared to a reference clock. The skew between the output clock signals for PI6C2308 is less than 200ps. When there are no rising edges on the REF input, the PI6C2308 enters a power down state. In this mode, the PLL is off and all outputs are Hi-Z. This results in less than 12µA of current draw. The Select Input Decoding Table shows additional examples when the PLL shuts down. The PI6C2308 configuration table shows all available devices.

The base part, PI6C2308-1, provides output clocks in sync with a reference clock. With faster rise and fall times, the PI6C2308-1H is the high drive version of the PI6C2308-1. Depending on which output drives the feedback pin, PI6C2308-2 provides 2X and 1X clock signals on each output bank. The PI6C2308-3 allows the user to obtain 4X and 2X frequencies on the outputs. The PI6C2308-4 provides 2X clock signals on all outputs. PI6C2308 (-1, -2, -3, -4) allows bank B to be Hi-Z when all output clocks are not required. The PI6C2308-6 allows bank B to switch from Reference clock to half of the frequency of Reference clock using the control inputs S1 and S2 if Bank A is connected to feedback FBK. In addition, using the control inputs S1 and S2, the PI6C2308-6 allows bank A to switch from Reference clock to 2X the frequency of Reference clock if Bank B is connected to feedback FBK. For testing purposes, the select inputs connect the input clock directly to outputs.

**Pin Configuration PI6C2308 (-1, -1H, -2, -3, -4, -6)**

**Select Input Decoding for PI6C2308 (-1, -1H, -2, -3, -4)**

S2	S1	CLKA [1-4]	CLKB [1-4]	Output Source	PLL Shutdown
0	0	Hi-Z	Hi-Z	PLL	Y
0	1	Driven	Hi-Z	PLL	N
1	0	Driven	Driven	Reference	Y
1	1	Driven	Driven	PLL	N

**Select Input Decoding for PI6C2308-6**

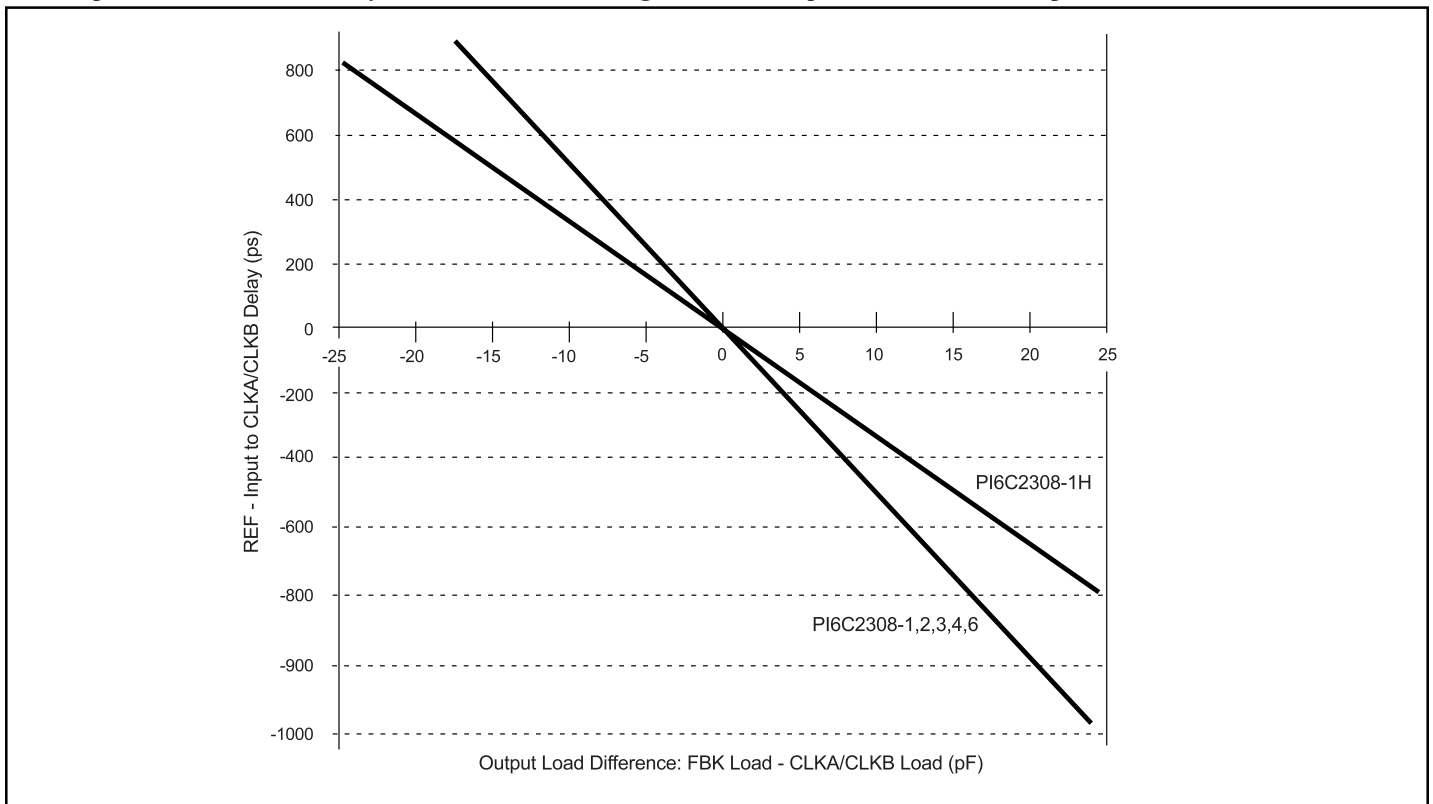

S2	S1	CLKA [1-4]	CLKB [1-4]	Output Source	PLL Shutdown
0	0	Hi-Z	Hi-Z	PLL	Y
0	1	Driven = Reference	Driven = Reference/2	Reference	Y
1	0	Driven = PLL	Driven = PLL	PLL	N
1	1	Driven = PLL	Driven = PLL/2	PLL	N

**Available PI6C2308 Configurations**

Device	Feedback From	Bank A Frequency	Bank B Frequency
PI6C2308-1	Bank A or Bank B	Reference	Reference
PI6C2308-1H	Bank A or Bank B	Reference	Reference
PI6C2308-2	Bank A	Reference	Reference/2
PI6C2308-2	Bank B	2X Reference	Reference
PI6C2308-3	Bank A	2X Reference	Reference
PI6C2308-3	Bank B	4X Reference	2X Reference
PI6C2308-4	Bank A or Bank B	2X Reference	2X Reference
PI6C2308-6	Bank A	Reference	Reference or Reference/2
PI6C2308-6	Bank B	Reference or 2X Reference	Reference

### Zero Delay and Skew Control

#### REF. Input to CLKA/CLKB Delay vs. Difference in Loading between FBK pin and CLKA/CLKB pins

To close the feedback loop of the PI6C2308, the FBK pin can be driven from any of the 8 available output pins. The output driving the FBK pin will be driving a total load of 7pF plus any additional load that it drives. The relative loading of this output (with respect to the remaining outputs) can adjust the input-output delay. This is shown in the graph above.

For applications requiring zero input-output delay, all outputs including the one providing feedback should be equally loaded. If input-output delay adjustments are required, use the above graph to calculate loading differences between the feedback output and remaining outputs.

### Maximum Ratings

Supply Voltage to Ground Potential .....	-0.5V to +7.0V
DC Input Voltage (Except REF) .....	-0.5V to $V_{DD}+0.5V$
DC Input Voltage REF .....	-0.5 to 7V
Storage Temperature .....	-65°C to +150°C
Maximum Soldering Temperature (10 seconds) .....	260°C
Junction Temperature .....	150°C
Static Discharge Voltage (per MIL-STD-883, Method 3015) .....	>2000V

### Operating Conditions

(Over operating range,  $T_A = 0^\circ\text{C}$  to  $+70^\circ\text{C}$ ,  $V_{CC} = 3.3V \pm 0.3V$ )

Parameter	Description	Min.	Max.	Units
$V_{DD}$	Supply Voltage	3.0	3.6	V
$T_A$	Operating Temperature (Ambient)	0	70	°C
$C_L$	Load Capacitance	—	30	pF
$C_{IN}$	Input Capacitance	—	7	

**Pin Description**

Pin	Signal	Description
1	REF <sup>(1)</sup>	Input reference frequency, 5V tolerant input, allows spread spectrum clock input
2	CLKA1 <sup>(2)</sup>	Clock output, Bank A
3	CLKA2 <sup>(2)</sup>	Clock output, Bank A
4	V <sub>DD</sub>	3.3V supply
5	GND	Ground
6	CLKB1 <sup>(2)</sup>	Clock output, Bank B
7	CLKB2 <sup>(2)</sup>	Clock output, Bank B
8	S2 <sup>(3)</sup>	Select input, bit 2
9	S1 <sup>(3)</sup>	Select input, bit 1
10	CLKB3 <sup>(2)</sup>	Clock output, Bank B
11	CLKB4 <sup>(2)</sup>	Clock output, Bank B
12	GND	Ground
13	V <sub>DD</sub>	3.3V, supply
14	CLKA3 <sup>(2)</sup>	Clock output, Bank A
15	CLKA4 <sup>(2)</sup>	Clock output, Bank A
16	FBK	PLL feedback input

**Electrical Characteristics for Commercial Temperature Devices**
