

COUNTERS/DIVIDERS

**4017B DECADE COUNTER WITH 10 DECODED OUTPUTS**

**4022B OCTAL COUNTER WITH 8 DECODED OUTPUTS**

- FULLY STATIC OPERATION
- MEDIUM SPEED OPERATION-12MHz (typ.) AT  $V_{DD} = 10V$
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD N° 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

**DESCRIPTION**

The **HCC4017B/4022B** (extended temperature range) and **HCF4017B/4022B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and plastic micro package.

The **HCC/HCF4017B** and **HCC/HCF4022B** are 5-stage and 4-stage Johnson counters having 10 and 8 decoded outputs, respectively. Inputs include a **CLOCK**, a **RESET**, and a **CLOCK INHIBIT** signal. Schmitt trigger action in the **CLOCK** input circuit provides pulse shaping that allows unlimited clock input pulse rise and fall times. These counters are advanced one count at the positive clock signal transition if the **CLOCK INHIBIT** signal is low. Counter advancement via the clock line is inhibited when the **CLOCK INHIBIT** signal is high. A high **RESET** signal clears the counter to its zero count. Use of the Johnson decade-counter configuration permits high-speed operation, 2-input decimal-decode gating, and spike-free decoded outputs. Anti-lock gating is provided, thus assuring proper counting sequence. The decoded outputs are normally low and go high only at their respective decoded time slot. Each decoded output remains high for one full clock cycle. A **CARRY-OUT** signal completes one

## HCC/HCF4017B/4022B

cycle every 10 clock input cycles in the HCC/HCF4017B or every 8 clock input cycles in the

HCC/HCF4022B and is used to ripple-clock the succeeding device in a multi-device counting chain.

### FUNCTIONAL DIAGRAM

### ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_{DD}^*$	Supply Voltage : HCC Types HCF Types	- 0.5 to + 20 - 0.5 to + 18	V
$V_I$	Input Voltage	- 0.5 to $V_{DD} + 0.5$	V
$I_I$	DC Input Current (any one input)	$\pm 10$	mA
$P_{tot}$	Total Power Dissipation (per package) Dissipation per Output Transistor for $T_{op} =$ Full Package-temperature Range	200 100	mW
$T_{op}$	Operating Temperature : HCC Types HCF Types	- 55 to + 125 - 40 to + 85	$^{\circ}C$
$T_{stg}$	Storage Temperature	- 65 to + 150	$^{\circ}C$

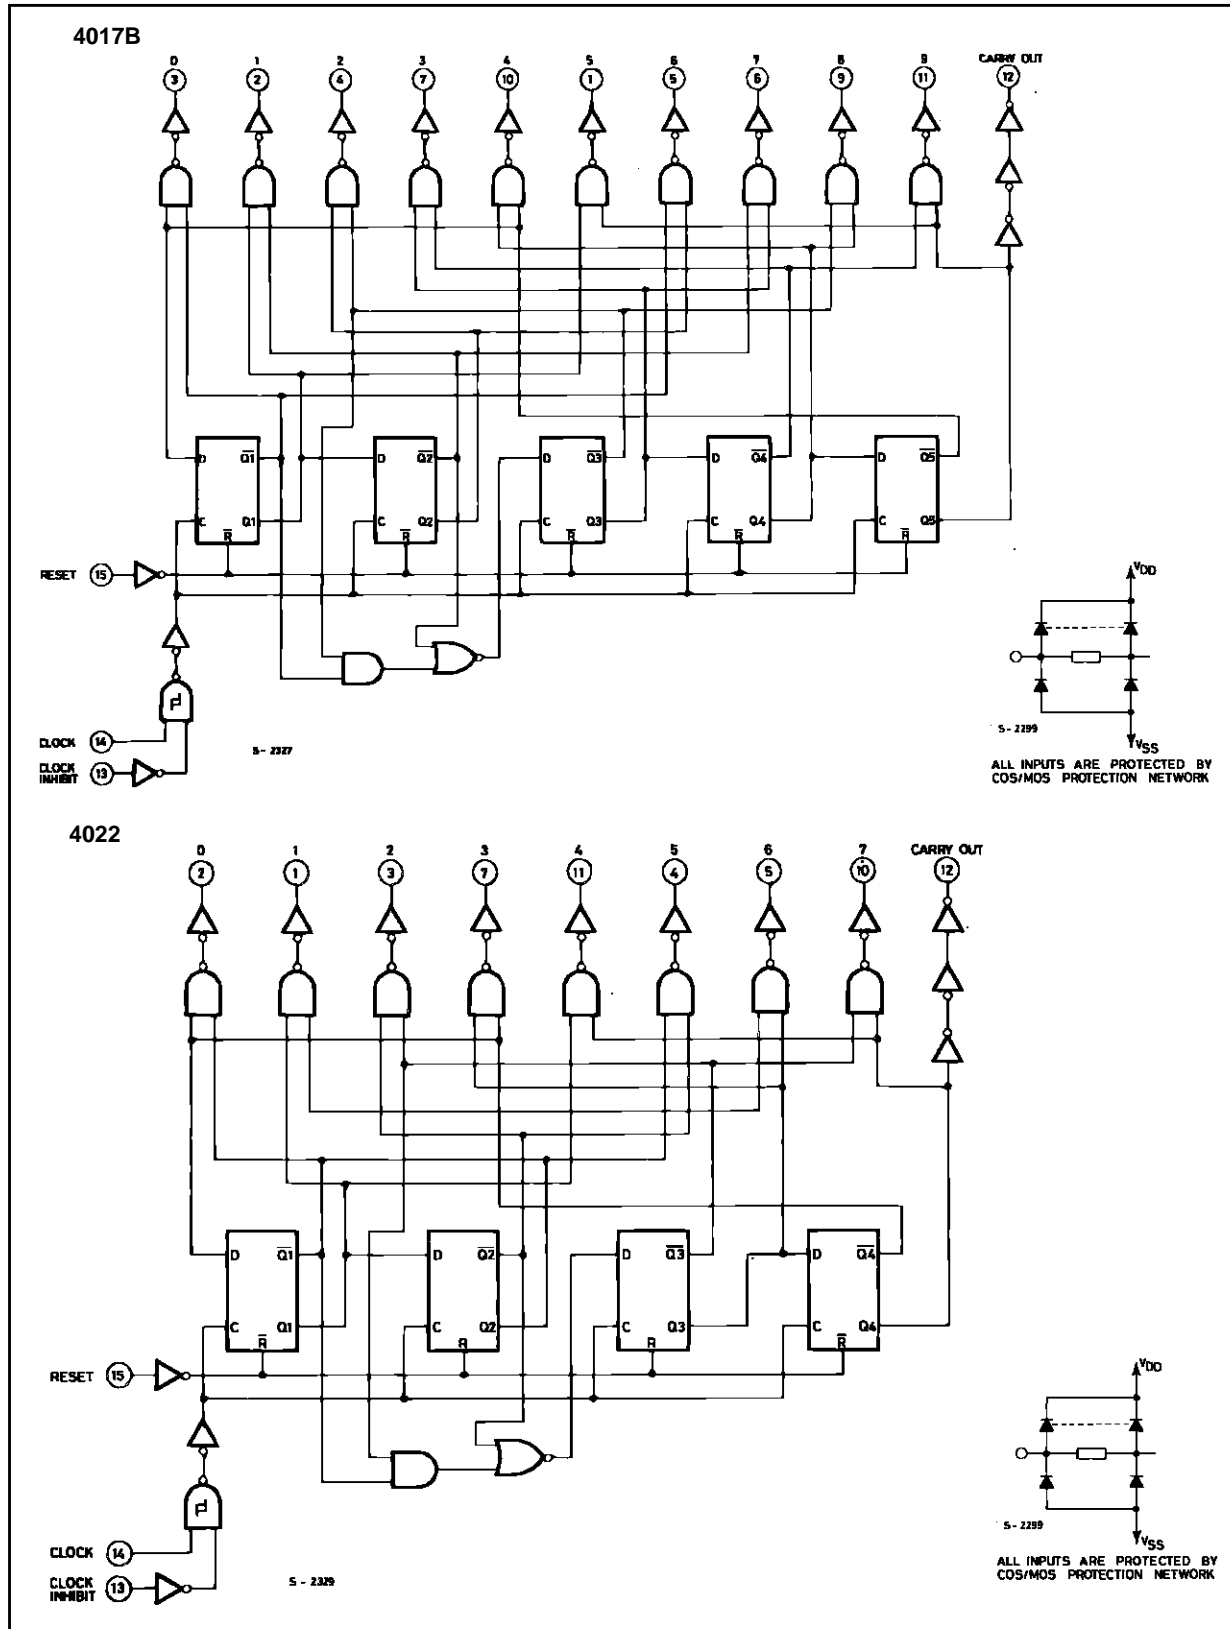

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for external periods may affect device reliability.

\* All voltages values are referred to  $V_{SS}$  pin voltage.

### RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage : HCC Types HCF Types	3 to 18 3 to 15	V
$V_I$	Input Voltage	0 to $V_{DD}$	V
$T_{op}$	Operating Temperature : HCC Types HCF Types	- 55 to + 125 - 40 to + 85	$^{\circ}C$

\* Measured with respect to carry output line.

Typical Output Low (sink) Current Characteristics.

Minimum Output Low (sink) Current Characteristics.

Typical Output High (source) Current Characteristics.

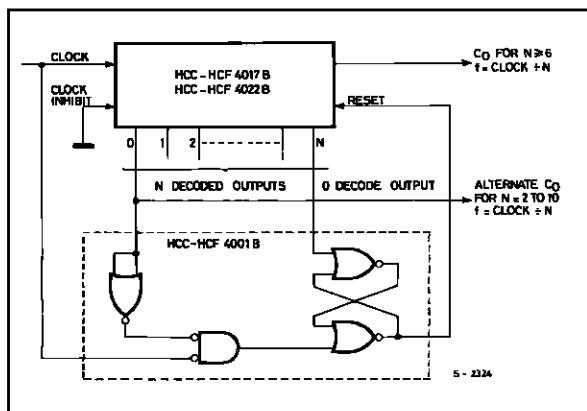

Minimum Output High (source) Current Characteristics.

TYPICAL APPLICATIONS

Divide by N Counter ( $N \leq 10$ ) with N Decoded Outputs.

When the  $N^{th}$  decoded output is reached ( $N^{th}$  clock pulse) the S-R flip-flop (constructed from two NOR gates of the HCC/HCF4001B) generates a reset pulse which clears the HCC/HCF4017B to its zero count. At this time, if the  $N^{th}$  decoded output is greater than or equal to 6, the  $C_{OUT}$  line goes high to clock the next HCC/HCF4017B counter section. The "0" decoded output also goes high at this time. Coincidence of the clock low and decoded "0" output high resets the S-R flip flop to enable the HCC/HCF4017B. If the  $N^{th}$  decoded output is less than 6, the  $C_{OUT}$  line will not go high and, therefore, cannot be used. In this case "0" decoded output may be used to perform the clocking function for the next counter.
