

Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
 - 2000 PLD Gates
 - 32 I/O Pins, Four Dedicated Inputs
 - 96 Registers
 - High-Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
- **HIGH-PERFORMANCE E²CMOS® TECHNOLOGY**
 - $f_{max} = 125$ MHz Maximum Operating Frequency
 - $t_{pd} = 7.5$ ns Propagation Delay
 - TTL Compatible Inputs and Outputs
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
 - In-System Programmable (ISP™) 5V Only
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Device for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
 - Complete Programmable Device Can Combine Glue Logic and Structured Designs
 - Enhanced Pin Locking Capability
 - Three Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control to Minimize Switching Noise
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispDesignEXPERT™ – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
 - Superior Quality of Results
 - Tightly Integrated with Leading CAE Vendor Tools
 - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER™
 - PC and UNIX Platforms

Functional Block Diagram

0138C1-isp

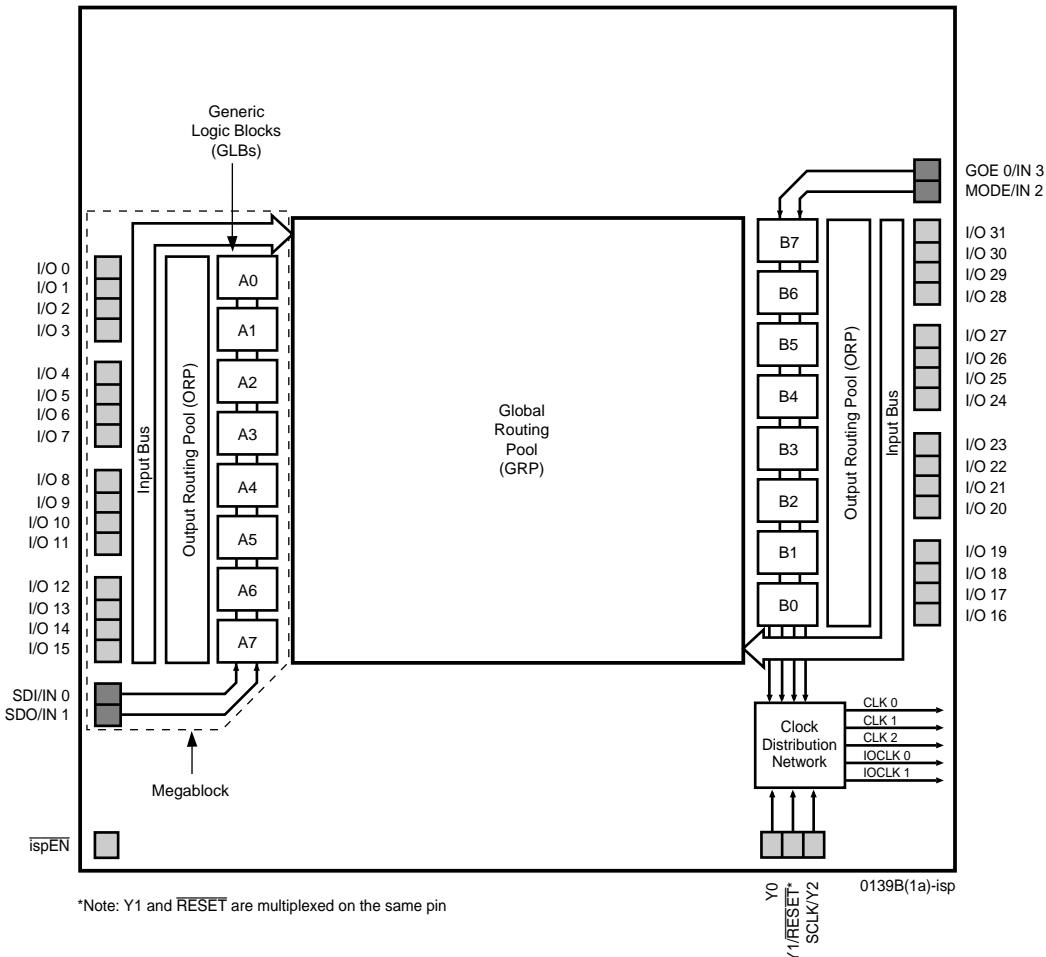

Description

The ispLSI 1016E is a High Density Programmable Logic Device containing 96 Registers, 32 Universal I/O pins, four Dedicated Input pins, three Dedicated Clock Input pins, one Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1016E features 5V in-system programming and in-system diagnostic capabilities. The ispLSI 1016E offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems. A functional superset of the ispLSI 1016 architecture, the ispLSI 1016E device adds a new global output enable pin.

The basic unit of logic on the ispLSI 1016E device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...A7 (see Figure 1). There are a total of 16 GLBs in the ispLSI 1016E device. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

Functional Block Diagram

Figure 1. *ispLSI 1016E* Functional Block Diagram

The device also has 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each *ispLSI 1016E* device contains two Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the *ispLSI 1016E* device are selected using the Clock Distribution Network. Three dedicated clock pins (Y0, Y1 and Y2) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (B0 on the *ispLSI 1016E* device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

Absolute Maximum Ratings 1

Supply Voltage V_{CC} -0.5 to +7.0V
 Input Voltage Applied -2.5 to V_{CC} +1.0V
 Off-State Output Voltage Applied -2.5 to V_{CC} +1.0V
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Conditions

SYMBOL	PARAMETER		MIN.	MAX.	UNITS
V_{CC}	Supply Voltage	Commercial T _A = 0°C to + 70°C	4.75	5.25	V
		Industrial T _A = -40°C to + 85°C	4.5	5.5	V
V_IL	Input Low Voltage		0	0.8	V
V_IH	Input High Voltage		2.0	V _{CC} +1	V

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP. ³	MAX.	UNITS
V_{OL}	Output Low Voltage	$I_{OL}= 8$ mA	—	—	0.4	V
V_{OH}	Output High Voltage	$I_{OH}= -4$ mA	2.4	—	—	V
I_{IL}	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$ (Max.)	—	—	-10	μA
I_{IH}	Input or I/O High Leakage Current	$3.5V \leq V_{IN} \leq V_{CC}$	—	—	10	μA
I_{IL-isp}	ispEN Input Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$	—	—	-150	μA
I_{IL-PU}	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq V_{IL}$	—	—	-150	μA
I_{OS} ¹	Output Short Circuit Current	$V_{CC}= 5V$, $V_{OUT}= 0.5V$	—	—	-200	mA
I_{CC} ^{2, 4}	Operating Power Supply Current	$V_{IL}= 0.5V$, $V_{IH}= 3.0V$ $f_{CLOCK}= 1$ MHz	Commercial	—	90	mA
			Industrial	—	90	mA

Table 2-0007/1016E

- One output at a time for a maximum duration of one second. $V_{OUT}= 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using four 16-bit counters.
- Typical values are at $V_{CC}= 5V$ and $T_A= 25^\circ C$.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

Maximum GRP Delay vs GLB Loads

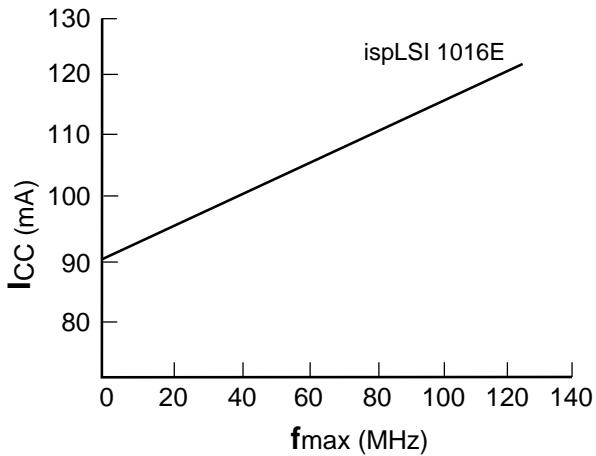

16E GRP/GLB.eps

Power Consumption

Power consumption in the ispLSI 1016E device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used.

Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of four 16-bit counters
 Typical current at 5V, 25°C

I_{CC} can be estimated for the ispLSI 1016E using the following equation:

$$I_{CC}(\text{mA}) = 23 + (\# \text{ of PTs} * 0.52) + (\# \text{ of nets} * \text{max freq} * 0.004)$$

Where:

of PTs = Number of product terms used in design

of nets = Number of signals used in device

Max freq = Highest clock frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions ($V_{CC} = 5.0\text{V}$, room temperature) and an assumption of four GLB loads on average exists and the device is filled with four 16-bit counters. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

Pin Description

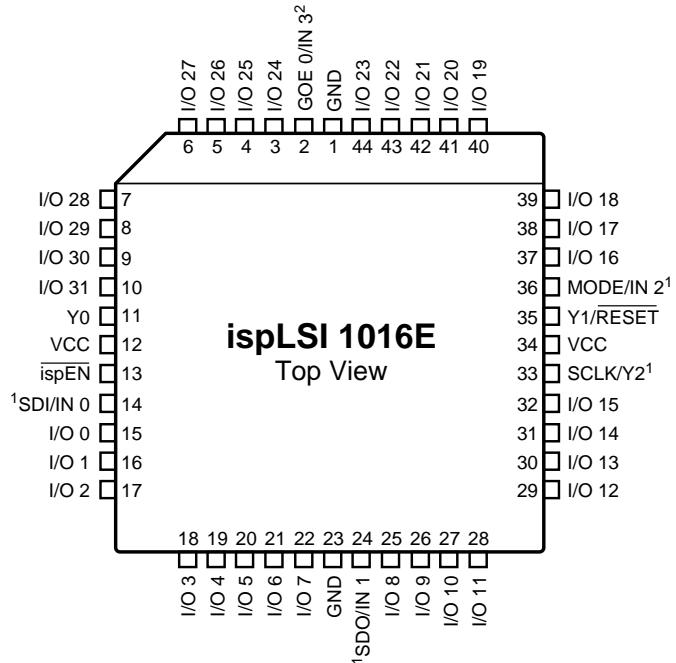

NAME	PLCC PIN NUMBERS	TQFP PIN NUMBERS	DESCRIPTION
I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31	15, 16, 17, 18, 19, 20, 21, 22, 25, 26, 27, 28, 29, 30, 31, 32, 37, 38, 39, 40, 41, 42, 43, 44, 3, 4, 5, 6, 7, 8, 9, 10	9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 21, 22, 23, 24, 25, 26, 31, 32, 33, 34, 35, 36, 37, 38, 41, 42, 43, 44, 1, 2, 3, 4	Input/Output Pins - These are the general purpose I/O pins used by the logic array.
GOE 0/IN 3 ²	2	40	This is a dual function pin. It can be used either as Global Output Enable for all I/O cells or it can be used as a dedicated input pin.
ispEN	13	7	Input - Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK controls become active.
SDI/IN 0 ¹	14	8	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an input pin to load programming data into the device. It is a dedicated input pin when <u>ispEN</u> is logic high. SDI/IN0 also is used as one of the two control pins for the isp state machine.
MODE/IN 2 ¹	36	30	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as a pin to control the operation of the isp state machine. It is a dedicated input pin when <u>ispEN</u> is logic high.
SDO/IN 1 ¹	24	18	Output/Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an output pin to read serial shift register data. It is a dedicated input pin when <u>ispEN</u> is logic high.
SCLK/Y2 ¹	33	27	Input - This pin performs two functions. When <u>ispEN</u> is logic low, it functions as a clock pin for the Serial Shift Register. It is a dedicated clock input when <u>ispEN</u> is logic high. This clock input is brought into the Clock Distribution Network, and can optionally be routed to any GLB and/or I/O cell on the device.
Y0	11	5	Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs on the device.
Y1/RESET	35	29	This pin performs two functions: <ul style="list-style-type: none"> - Dedicated clock input. This clock input is brought into the Clock Distribution Network, and can optionally be routed to any GLB and/or I/O cell on the device. - Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
GND	1, 23	17, 39	Ground (GND)
VCC	12, 34	6, 28	Vcc
