# **Dual Master-Slave J-K Flip-Flops with Clear and Complementary Outputs**

#### **General Description**

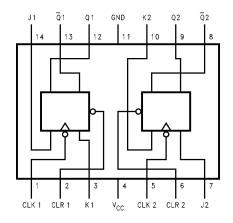

This device contains two independent positive pulse triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flops after a complete clock pulse. While the clock is LOW the slave is isolated from the master. On the positive transition of the clock, the data from the J and K inputs is transferred to the master. While the clock is HIGH the J and K inputs are disabled. On the

negative transition of the clock, the data from the master is transferred to the slave. The logic states of the J and K inputs must not be allowed to change while the clock is HIGH. Data transfers to the outputs on the falling edge of the clock pulse. A LOW logic level on the clear input will reset the outputs regardless of the logic states of the other inputs.

Н	<b>小</b>	L	L	$Q_0$	$\overline{Q}_0$	
Н	<b>小</b>	Н	L	Н	L

Н	九	Н	Н	Toggle		

- H = HIGH Logic Level L = LOW Logic Level
- X = Either LOW or HIGH Logic Level
- \_\_ = Positive pulse data. the J and K inputs must be held constant while the clock is HIGH. Data is transferred to the outputs on the falling edge of the clock pulse.
- $\mathbf{Q}_0 = \mathbf{The}$  output logic level before the indicated input conditions were established.
- Toggle = Each output changes to the complement of its previous level on each HIGH level clock pulse.

# Absolute Maximum Ratings(Note 1)

Supply Voltage 7V Input Voltage 5.5V Operating Free Air Temperature Range  $0^{\circ}\text{C to } +70^{\circ}\text{C}$  Storage Temperature Range  $-65^{\circ}\text{C to } +150^{\circ}\text{C}$ 

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 4: All typicals are at  $V_{CC} = 5V$ ,  $T_A = 25$ °C.

Note 5: Not more than one output should be shorted at a time.

Note 6: With all outputs OPEN,  $I_{CC}$  is measured with the Q and  $\overline{Q}$  outputs HIGH in turn. At the time of measurement the clock input grounded.
