HEMT-3300

Features

- **High Efficiency**
- **Nonsaturating Output**
- **Narrow Beam Angle**
- **Visible Flux Aids Alignment**
- **Bandwidth: DC to 3 MHz**
- **IC Compatible/Low Current Requirement**

Description

The HEMT-3300 is a visible, near-IR, source using a GaAsP on GaP LED chip optimized for maximum quantum efficiency at 670 nm. The emitter's beam is sufficiently narrow to minimize stray flux problems, yet broad enough to simplify optical

alignment. This product is suitable for use in consumer and industrial applications such as optical transducers and encoders, smoke detectors, assembly line monitors, small parts counters, paper tape readers, and fiber optic drivers.

Notes:

- $I_e(T) = I_e(25^\circ\text{C})\exp[K_e(T - 25^\circ\text{C})]$.
- $I_v = \eta_v I_e$ where I_v is in candela, I_e in watts/steradian and η_v in lumen/watt.
- $\theta_{1/2}$ is the off-axis angle at which the radiant intensity is half the axial intensity.
- $\lambda_{\text{PEAK}}(T) = \lambda_{\text{PEAK}}(25^\circ\text{C}) + (\Delta\lambda_{\text{PEAK}}/\Delta T)(T - 25^\circ\text{C})$.
