AOD438

N-Channel Enhancement Mode Field Effect Transistor

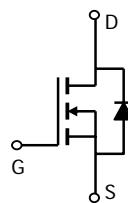

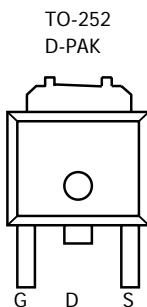

General Description

The AOD438 uses advanced trench technology to provide excellent $R_{DS(ON)}$, low gate charge and low gate resistance. This device is ideally suited for use as a low side switch in CPU core power conversion. Standard Product AOD438 is Pb-free (meets ROHS & Sony 259 specifications). AOD438L is a Green Product ordering option. AOD438 and AOD438L are electrically identical.

Features

V_{DS} (V) = 30V
 I_D = 85A (V_{GS} = 10V)
 $R_{DS(ON)} < 3.5m\Omega$ (V_{GS} = 10V)
 $R_{DS(ON)} < 5.5m\Omega$ (V_{GS} = 4.5V)

Absolute Maximum Ratings $T_A=25^\circ C$ unless otherwise noted

A: The value of R_{JJA} is measured with the device mounted on 1 in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{C}$. The Power dissipation P_{DSM} is based on steady-state R_{JJA} and the maximum allowed junction temperature of 150°C . The value in any given application depends on the user's specific board design, and the maximum temperature of 175°C may be used if the PCB or heatsink allows it.

B. The power dissipation P_D is based on $T_{J(\text{MAX})}=175^\circ\text{C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used. It is used to determine the current rating, when this rating falls below the package limit.

C: Repetitive rating, pulse width limited by junction temperature $T_{J(\text{MAX})}=175^\circ\text{C}$.

D. The R_{JJA} is the sum of the thermal impedance from junction to case R_{JJC} and case to ambient.

E. The static characteristics in Figures 1 to 6 are obtained using <300 μs pulses, duty cycle 0.5% max.

F. These tests are performed with the device mounted on 1 in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{C}$. The SOA curve provides a single pulse rating.

G. The maximum current rating is limited by the package current capability.
