3 Terminal Description

3.1 UART

Four signals are used to implement the UART function. **UART_TXD** and **UART_RXD** transfer data between the two devices. The remaining two signals, **UART_CTS** and **UART_RTS**, can be used to implement RS232 hardware flow control where both are active low indicators.

3.1.1 UART Setting

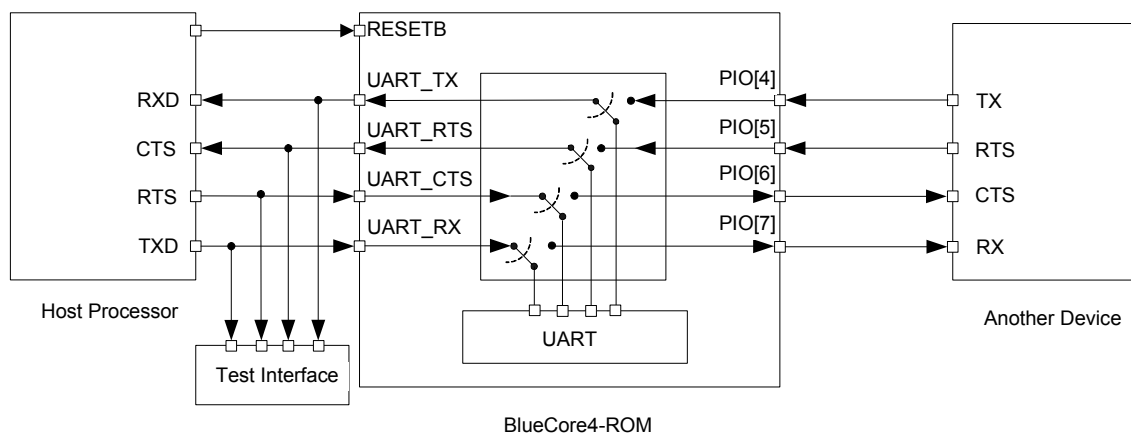

User can change data format the following selection using PSKEY. However, host shall communicate with default setting UART connection initiated at first time.

$$\text{Baud Rate} = (\text{PSKEY_UART_BAUD_RATE}) / 0.004096$$

Parameter	Possible value
Baud Rate	9600 ~ 3M Baud
Flow Control	RTS/CTS or None
Parity	None, Odd or Even
Number of Stop Bits	1 or 2
Bits per channel	8

3.1.2 UART Bypass Mode

Switch the bypass to PIO[7:4] as shown in figure. When the bypass mode has been invoked, module enters the deep sleep state indefinitely.

3.2 USB

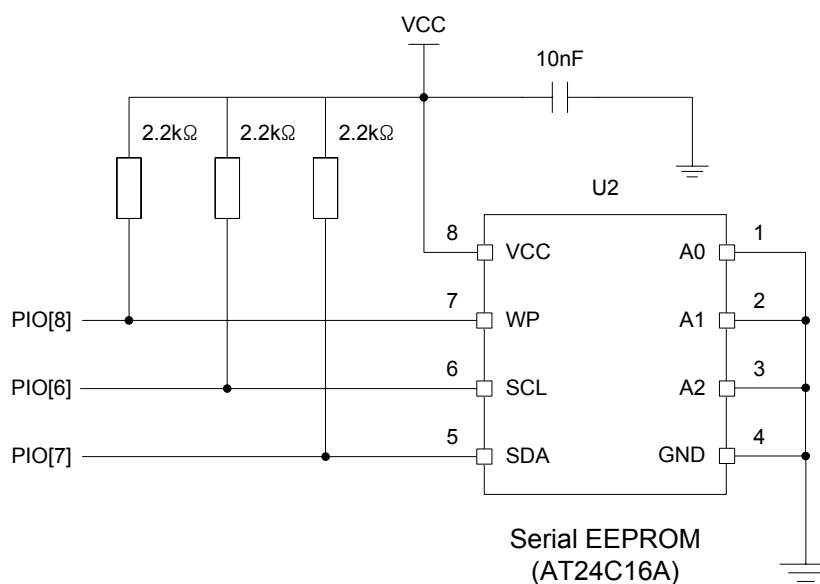

This Bluetooth module contains a full speed (12Mbit/s) USB interface that is capable of driving a USB cable directly. No external USB transceiver is required. The device operates as a USB peripheral, responding to requests from a master host controller such as a PC. Both the OHCI and the UHCI standards are supported. The set of USB endpoints implemented can behave as specified in the USB section of the Bluetooth specification v2.0 + EDR or alternatively can appear as a set of endpoints appropriate to USB audio devices such as a set of USB speakers.

USB is a master/slave oriented system (in common with other USB peripherals). This Module only supports USB slave operation.

3.3 I²C

PIO[8:6] can be used to form an interface. The interface is driven by “bit banging” these PIO pins using software. Therefore it is suited only to relatively slow functions such as driving a dot matrix liquid crystal display (LCD).

Note. PIO[7:6] dual functions, UART bypass and EEPROM support, therefore devices using an EEPROM connect support UART bypass mode. PIO Lines need to be pulled-up through 2.2KΩ resistors.

3.4 PCM

Pulse Code Modulation (PCM) is a standard method used to digitize audio (particularly voice) patterns for transmission over digital communication channels. Through its PCM interface, this module has hardware support for continual transmission and reception of PCM data, so reducing processor overhead for wireless headset applications. This module offers a bi-directional digital audio interface that route directly into the baseband layer of the on-chip firmware. It dose not pass through the HCI protocol layer.

Hardware allows the data to be sent to and received from a SCO connection

This module interfaces directly to PCM audio devices including the following :

- **Qualcomm MSM 3000 series and MSM 5000 series CDMA baseband devices**
- **OKI MSM7705 for channel A-law and u-law CODEC**
- **Motorola MC145481 8-bit A-law and u-law CODEC**
- **Motorola MC145483 13-bit linear CODEC**
- **STW 5093 and 5094 14-bit linear CODECs**

3.4.1 PCM Configuration

The PCM configuration is set using two PS keys, PSKEY_PCM_CONFIG32 and PSKEY_PCM_LOW_JITTER_CONFIG. The default for long frame sync and interface master generating 256KHz PCM_CLK with no tristating of PCM_OUT.

Parameter	Possible value
Mode	Slave, Master
Clock Rate	Master Mode : 128, 256, 512KHz Slave Mode : up to 2048KHz
Sync Formats	Long frame sync, Short frame sync
Data Formats	13 or 16bit linear, 8 - bit A - law to u - law

4 Boot Interface Configures

The firmware configures itself when it boots by reading the value on a set PIO pins
