

TSH80-TSH81-TSH82

Wide Band, Rail-to-Rail Operational Amplifier with Standby Function

- **4.5V, 12V** operating conditions
- 3dB-bandwidth: 100MHz
- Slew-rate: **100V/μs**
- Output current: up to **55mA**
- Input single supply voltage
- Output rail-to-rail
- Specified for 150Ω load
- Low distortion, THD: **0.1%**
- SOT23-5, TSSOP and SO packages

Description

The TSH8x series offers single and dual operational amplifiers featuring high video performances with large bandwidth, low distortion and excellent supply voltage rejection. These amplifiers feature also large output voltage swing and high output current capability to drive standard 150Ω loads.

Running at single or dual supply voltage from 4.5V to 12V, these amplifiers are tested at 5V(±2.5V) and 10V(±5V) supplies.

The TSH81 also features a standby mode, which allows the operational amplifier to be put into a standby mode with low power consumption and high output impedance. The function allows power saving or signals switching/multiplexing for high speed applications and video applications.

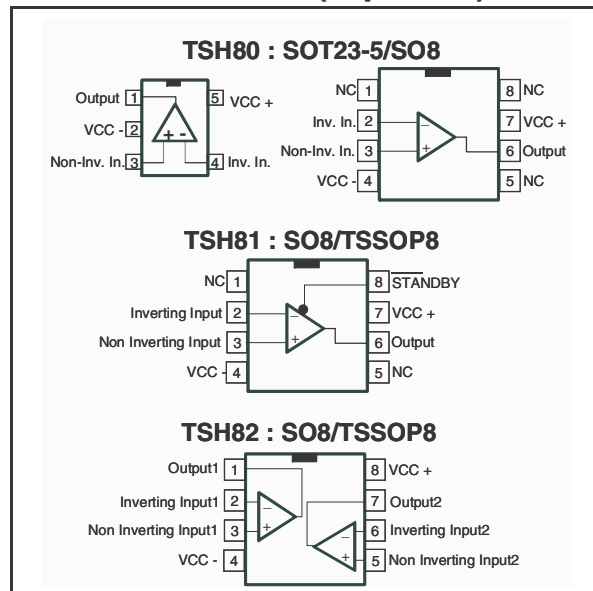

For board space and weight saving, TSH8x series is proposed in SOT23-5, TSSOP8 and SO-8 packages.

Application

- Video buffers
- A/D converters driver
- Hi-Fi applications

3 Inter Modulation Products

The IFR2026 synthesizer generates a two tones signal (F1=180kHz, F2=280kHz); each tone having the same amplitude level.

The HP3585 spectrum analyzer measures the inter modulation products function of the output voltage. The generator and the spectrum analyzer are phase locked for precision considerations.

4 Testing Conditions

4.1 Layout precautions:

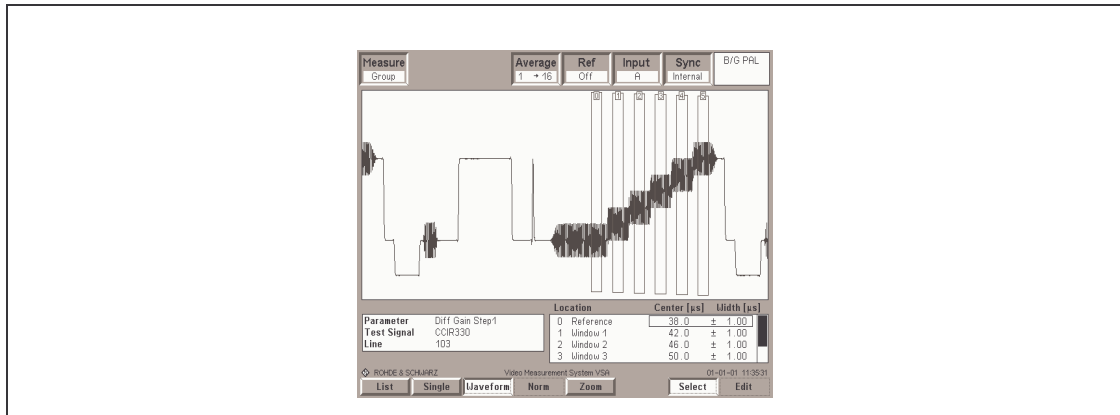

To use the TSH8X circuits in the best manner at high frequencies, some precautions have to be taken for power supplies:

- First of all, the implementation of a proper ground plane in both sides of the PCB is mandatory for high speed circuit applications to provide low inductance and low resistance common return.
- Power supply bypass capacitors (4.7uF and ceramic 100pF) should be placed as close as possible to the IC pins in order to improve high frequency bypassing and reduce harmonic distortion. The power supply capacitors must be incorporated for both the negative and the positive pins.
- Proper termination of all inputs and outputs must be in accordance with output termination resistors; then the amplifier load will be only resistive and the stability of the amplifier will be improved.

All leads must be wide and as short as possible especially for op amp inputs and outputs in order to decrease parasitic capacitance and inductance.

- For lower gain application, attention should be paid not to use large feedback resistance (>1kΩ) to reduce time constant with parasitic capacitances.
- Choose component sizes as small as possible (SMD).
- Finally, on output, the load capacitance must be negligible to maintain good stability. You can put a serial resistance the closest to the output pin to minimize its influence.

Figure 31. CCIR330 video line

4.2 Maximum input level:

The input level must not exceed the following values:

- Negative peak: must be greater than $-V_{cc}+400mV$.
- Positive peak value: must be lower than $+V_{cc}-400mV$.

The electrical characteristics show the influence of the load on this parameter.

4.3 Video capabilities:

To characterize the differential phase and differential gain a CCIR330 video line is used. The video line contains 5 (flat) levels of luma on which is superimposed chroma signal. (the first level contains no luma). The luma gives various amplitudes which define the saturation of the signal. The chrominance gives various phases which define the color of the signal. Differential phase (respectively differential gain) distortion is present if a signal chrominance phase (gain) is affected by luminance level. They represent the ability to uniformly process the high frequency information at all luminance levels. When differential gain is present, color saturation is not correctly reproduced. The input generator is the Rhode & Schwarz CCVS. The output measurement is done by the Rhode and Schwarz VSA.

Figure 32. Measurement on Rhode and Schwarz VSA

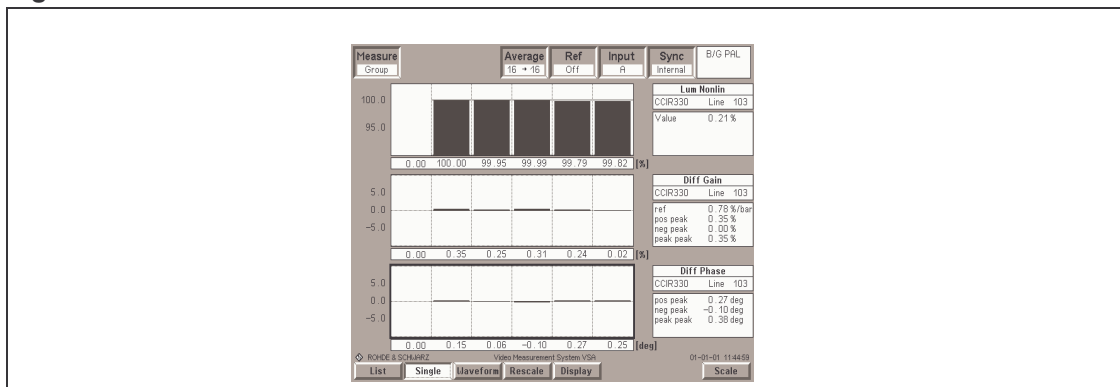

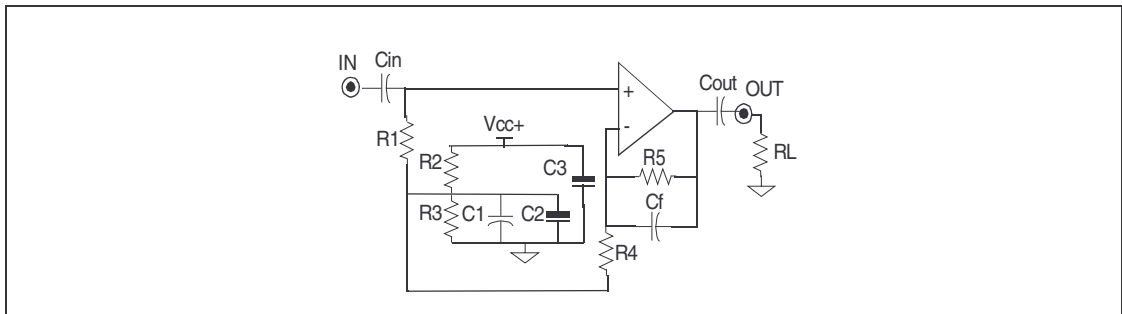

Table 6. Video results

Parameter	Value (Vcc=±2.5V)	Value (Vcc=±5V)	Unit
Lum NL	0.1	0.3	%
Lum NL Step 1	100	100	%
Lum NL Step 2	100	99.9	%

Diff Gain Step2	-0.7	-0.6	%
Diff Gain Step3	-0.3	-0.5	%
Diff Gain Step4	-0.1	-0.3	%
Diff Gain Step5	-0.4	-0.5	%
Diff Phase pos	0	0.1	deg
Diff Phase neg	-0.2	-0.4	deg
Diff Phase pp	0.2	0.5	deg
Diff Phase Step1	-0.2	-0.4	deg
Diff Phase Step2	-0.1	-0.4	deg
Diff Phase Step3	-0.1	-0.3	deg
Diff Phase Step4	0	0.1	deg
Diff Phase Step5	-0.2	-0.1	deg

5 Precautions on Asymmetrical Supply Operation

The TSH8X can be used either with a dual or a single supply. If a single supply is used, the inputs are biased to the mid-supply voltage ($+V_{cc}/2$). This bias network must be carefully designed, in order to reject any noise present on the supply rail.

As the bias current is 15uA, you must carefully choose the resistance R1 not to introduce an offset mismatch at the amplifier inputs.

$R1=10k\Omega$ will be convenient. C1, C2, C3 are bypass capacitors from perturbation on Vcc as well as for the input and output signals. We choose $C1=100nF$ and $C2=C3=100\mu F$.

R2, R3 are such that the current through them must be superior to 100 times the bias current. So, we take $R2=R3=4.7k\Omega$.

Cin, as Cout are chosen to filter the DC signal by the low pass filters (R1, Cin) and (Rout, Cout). By taking $R1=10k\Omega$, $R_L=150\Omega$, and $C_{in}=2\mu F$, $C_{out}=220\mu F$ we provide a cutoff frequency below 10Hz.

Figure 33. Use of the TSH8x in gain = -1 configuration

Some precautions have to be added, specially for low power supply application.

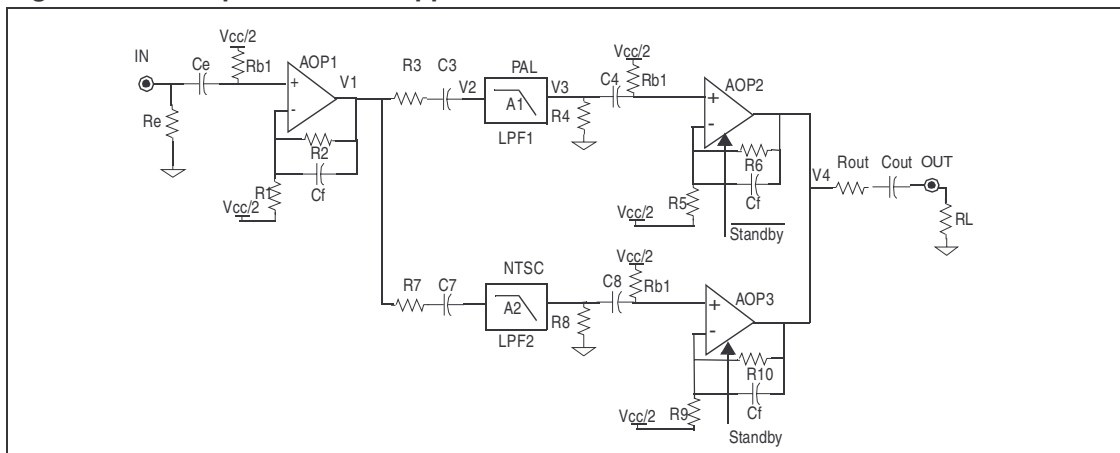

A feedback capacitance Cf should be added for better stability.

The table summarizes the impact of the capacitance Cf on the phase margin of the circuit.

Table 7. Capacitance Cf on the phase margin of the circuit

Parameter	Cf (pF)	Vcc=±1.5V	Vcc=±2.5V	Vcc=±5V	Unit
Phase Margin	0	28	43	56	deg
f-3dB		40	39.3	38.3	MHz
Phase Margin	5.6	30	43	56	deg
f-3dB		40	39.3	38.3	MHz

f-3dB		33.7	30.7	27.6	MHz

Figure 34. Example of a video application

This example shows a possible application of the TSH8X circuit. Here, you can multiplex the channels for the different standard PAL, NTSC as you filter for the different bands; the video signal can be filtered with two different cutoff frequencies, corresponding to a PAL encoded signal (LPF1) or a NTSC signal (LPF2).

You can multiplex input signals, as the outputs are in high impedance state in standby mode. This enables you, to use a PAL filter as the Standby mode is active and to use the NTSC filter otherwise.

The video application requires 1V_{peak} at input and output.

Calculation of components:

A decoupling capacitor is provided to cutoff the frequencies below 10Hz according I bias. Hence $C_e=10\mu\text{F}$, with $R_{b1}=10\text{k}\Omega$. At the output, $C_{out}=220\mu\text{F}$.

The AOP1 is in 6dB configuration for the adaptation bridge. $R_1=R_2=1\text{k}\Omega$, $V_1=2\text{V}_{pk}$, $V_2=1\text{V}_{pk}$

For the PAL communication, we need a low pass filtering. The load resistance R_4 is function of the output resistance of the filter. $V_3=V_2/A_1$ where A_1 is the attenuation factor of the filter LPF1.

To compensate the filter insertion loss, we add an additional factor to the gain of the 2nd amplifier AOP2.

For example, for an attenuation of 3dB, we choose $R_5=300\Omega$ and $R_6=1\text{k}\Omega$. We have $V_4=2\text{V}_{pk}$ and $V_{out}=1\text{V}_{pk}$.

The calculation of the parameters R_7 , C_7 , R_8 , C_8 , R_9 , R_{10} will be exactly the same

6 Package Mechanical Data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
