ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 5 of this data sheet.

Description

The MC100LVE310 is a low voltage, low skew 2:8 differential ECL fanout buffer designed with clock distribution in mind. The device features fully differential clock paths to minimize both device and system skew. The LVE310 offers two selectable clock inputs to allow for redundant or test clocks to be incorporated into the system clock trees.

To ensure that the tight skew specification is met it is necessary that both sides of the differential output are terminated into 50 Ω, even if only one side is being used. In most applications all eight differential pairs will be used and therefore terminated. In the case where fewer than eight pairs are used it is necessary to terminate at least the output pairs adjacent to the output pair being used in order to maintain minimum skew. Failure to follow this guideline will result in small degradations of propagation delay (on the order of 10 − 20 ps) of the outputs being used, while not catastrophic to most designs this will result in an increase in skew. Note that the package corners isolate outputs from one another such that the guideline expressed above holds only for outputs on the same side of the package.

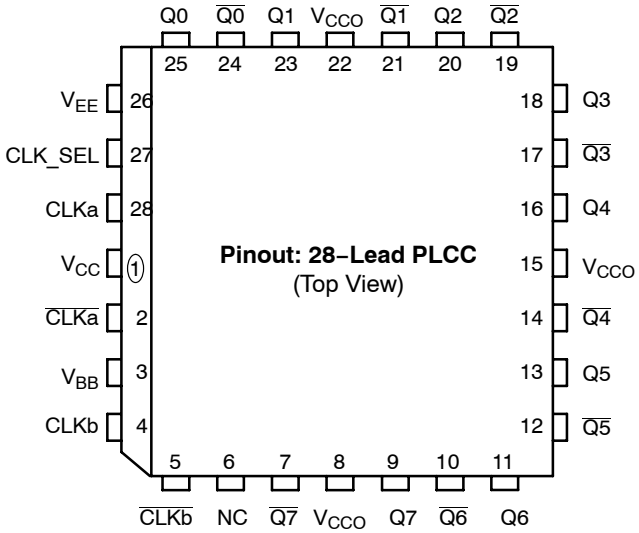
The MC100LVE310, as with most ECL devices, can be operated from a positive V_{CC} supply in LVPECL mode. This allows the LVE310 to be used for high performance clock distribution in +3.3 V systems. Designers can take advantage of the LVE310's performance to distribute low skew clocks across the backplane or the board. In a PECL environment series or Thevenin line terminations are typically used as they require no additional power supplies, if parallel termination is desired a terminating voltage of V_{CC} − 2.0 V will need to be provided. For more information on using PECL, designers should refer to Application Note AN1406/D.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Features

- 200 ps Part−to−Part Skew
- 50 ps Output−to−Output Skew
- PECL Mode Operating Range:
  V_{CC} = 3.0 V to 3.8 V with V_{EE} = 0 V
- NECL Mode Operating Range:
  V_{CC} = 0 V with V_{EE} = −3.0 V to −3.8 V
- Q Output will Default LOW with All Inputs Open or at V_{EE}
- The 100 Series Contains Temperature Compensation
- Pb−Free Packages are Available*

*For additional information on our Pb−Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.



Warning: All V_{CC}, V_{CCO}, and V_{EE} pins must be externally connected to Power Supply to guarantee proper operation.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

2. Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary ±0.3 V.
3. Outputs are terminated through a 50 Ω resistor to V_{CC} − 2 V.
4. V_{IHCMR} min varies 1:1 with V_{EE}, max varies 1:1 with V_{CC}. V_{IHCMR} is defined as the range within which the V_{IH} level may vary, with the device still meeting the propagation delay specification. The V_{IL} level must be such that the peak to peak voltage is less than 1.0 V and greater than or equal to V_{PP}(min).

Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

8. V_{EE} can vary ±0.3 V.
9. The differential propagation delay is defined as the delay from the crossing points of the differential input signals to the crossing point of the differential output signals.
10. The single-ended propagation delay is defined as the delay from the 50% point of the input signal to the 50% point of the output signal.
11. The within−device skew is defined as the worst case difference between any two similar delay paths within a single device.
12. V_{PP}(min) is defined as the minimum input differential voltage which will cause no increase in the propagation delay. The V_{PP}(min) is AC limited for the LVE310 as a differential input as low as 50 mV will still produce full ECL levels at the output.
