

Fault-Protected Single 8-Ch/Differential 4-Ch Analog Multiplexers

FEATURES

- Fault and Overvoltage Protection
- All Channels Off When Power Off
- Latchup-Proof
- Fast Switching— T_A : 200 ns
- Break-Before-Make Switching
- Low On-Resistance: 180 Ω
- Low Power Consumption: 3 mW
- TTL and CMOS Compatible Inputs

BENEFITS

- Improved Ruggedness
- Power Loss Protection
- Prevents Adjacent Channel Crosstalk
- Standard Logic Interface
- Superior Accuracy
- Fast Settling Time

APPLICATIONS

- Data Acquisition Systems
- Industrial Process Control Systems
- Avionics Test Equipment
- High-Rel Control Systems
- Telemetry

DESCRIPTION

The DG458 and DG459 are 8-channel single-ended and 4-channel differential analog multiplexers, respectively, incorporating fault protection. A series n-p-n MOSFET structure provides device and signal-source protection in the event of power loss or overvoltages. Under fault conditions the multiplexer input (or output) appears as an open circuit and only a few nanoamperes of leakage current will flow. This protects not only the multiplexer and the circuitry following it, but also protects the sensors or signal sources which drive the multiplexer.

The DG458 and DG459 can withstand continuous overvoltage inputs up to ± 35 V. All digital inputs have TTL compatible logic thresholds. Break-before-make operation prevents channel-to-channel interference.

The DG458 and DG459 are improved pin-compatible replacements for HI-508A/509A and MAX358/359 multiplexers.

Notes:

a. Refer to PROCESS OPTION FLOWCHART.

b. Room = 25°C, Full = as determined by the operating temperature suffix.

c. Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.

d. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.

e. Guaranteed by design, not subject to production test.

f. V_{IN} = input voltage to perform proper function.g. When the analog signal exceeds the +13.5 V or –12 V, $r_{DS(on)}$ starts to rise until only leakage currents flow.

$$h. \Delta r_{DS(on)} = \left(\frac{r_{DS(on) \text{ MAX}} - r_{DS(on) \text{ MIN}}}{r_{DS(on) \text{ AVE}}} \right) \times 100\%$$

DETAILED DESCRIPTION

The Vishay Siliconix DG458 and DG459 multiplexers are fully fault- and overvoltage-protected for continuous input voltages up to ± 35 V whether or not voltage is applied to the power supply pins ($V+$, $V-$). These multiplexers are built on a high-voltage junction-isolated silicon-gate CMOS process. Two n-channel and one p-channel MOSFETs are connected in series to form each channel (Figure 1).

Within the normal analog signal range (± 10 V), the $r_{DS(on)}$ variation as a function of analog signal voltage is comparable to that of the classic parallel N-MOS and P-MOS switches.

When the analog signal approaches or exceeds either supply rail, even for an on-channel, one of the three series MOSFETs gets cut-off, providing inherent protection against overvoltages even if the multiplexer power supply voltages are lost. This protection is good up to the breakdown voltage of the respective series MOSFETs. Under fault conditions only sub microamp leakage currents can flow in or out of the multiplexer. This not only provides protection for the multiplexer and succeeding circuitry, but it allows normal, undisturbed operation of all other channels. Additionally, in case of power loss to the multiplexer, the loading caused on the transducers and signal sources is insignificant, therefore redundant multiplexers can be used on critical applications such as telemetry and avionics.
