Preface

Thank you very much for making use of Toshiba microcomputer LSIs. Before use this LSI, refer the section, “Points of Note and Restrictions”.

Especially, take care below cautions.

CAUTION

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0 to 4, INTRTC) which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 5 clocks of f_{FPH}) with IDLE1 or STOP mode (IDLE2 is not applicable to this case). (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficultly. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

3. Functional Description

This section shows the hardware configuration of the TMP91FY12A and explains how it operates.

This device is a version of the created by replacing the predecessor's internal mask ROM with a 256-Kbyte internal flash memory. The configuration and the functionality of this device are the same as those of the TMP91CW12A. For the functions of this device that are not described here, refer to the TMP91CW12A data sheet.

3.1 Outline of operation modes

There are single-chip and single-boot modes. Which mode is selected depends on the device's pin state after a reset (including when the watchdog timer output is connected to reset (inside the chip)).

- Single Chip Mode: The device normally operates in this mode. After a reset, the device starts executing the internal flash memory program.
- Single Boot Mode: This mode is used to rewrite the internal flash memory by serial transfer (UART). After a reset, the internal boot ROM starts up, executing a on-board rewrite program.

Operation Mode	Mode Setup Input Pin			
	$\overline{\text{RESET}}$	$\overline{\text{BOOT}}$ (P37)	AM0	AM1
Single-chip mode	↑	H	H	H
Single-boot mode		L		

3.2 Memory Map

The memory map of this device differs from that of the TMP91CW12A.

Figure 3.2.1 shows a memory map of the device in single-chip mode and its memory areas that can be accessed in each addressing mode of the CPU.

Output Current	IOL	2	mA
Output Current	IOH	−2	mA
Output Current (total)	ΣIOL	80	mA
Output Current (total)	ΣIOH	−80	mA

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

(2) INT5 to INT8 Interrupts, Capture

The INT5 to INT8 input width depends on the system clock and prescaler clock settings.

System Clock Selected <SYSCK>	Prescaler Clock Selected <PRCK1, PRCK0>	t_{INTBL} (INT5 to INT8 Low level Width)		t_{INTBH} (INT5 to INT8 High Level Width)		Unit
		Variable	f_{FPH} = 27 MHz	Variable	f_{FPH} = 27 MHz	
		Min	Min	Min	Min	
0 (fc)	00 (f_{FPH})	8X + 100	396	8X + 100	396	ns
	10 (fc/16)	128Xc + 0.1	4.8	128Xc + 0.1	4.8	μs
1 (fs)	00 (f_{FPH})	8X + 0.1	244.3	8X + 0.1	244.3	

Note: Xc = Period of Clock fc

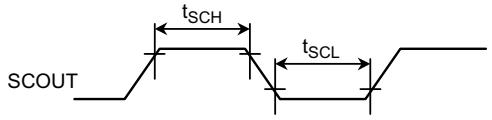
4.8 SCOUT Pin AC Characteristics

Parameter	Symbol	Variable		10 MHz		27 MHz		Condition	Unit
		Min	Max	Min	Max	Min	Max		
Low level Width	t_{SCH}	0.5T – 13		37		5		Vcc = 2.7 to 3.6 V	ns
High level Width	t_{SCL}	0.5T – 13		37		5		Vcc = 2.7 to 3.6 V	ns

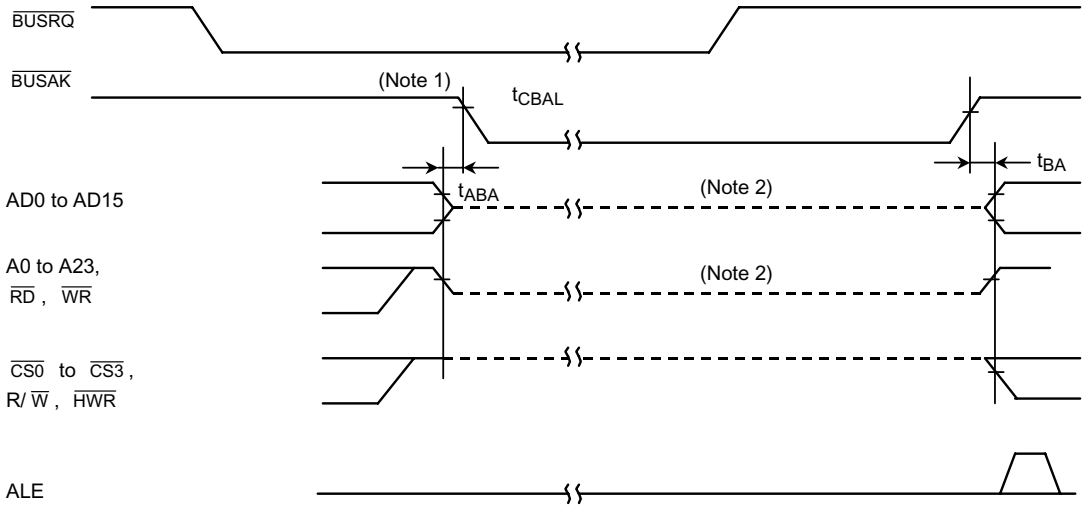
Note: T = Period of SCOUT

Measrement Condition

- Output Level: High 0.7 Vcc/Low 0.3 Vcc, CL = 10 pF



4.9 Bus Request/Bus Acknowledge



Paramter	Symbol	Variable		f_{FPH} = 10 MHz		f_{FPH} = 27 MHz		Condition	Unit
		Min	Max	Min	Max	Min	Max		
Output Buffer Off to $\overline{BUSAK}$ Low	t_{ABA}	0	80	0	80	0	80	Vcc = 2.7 to 3.6 V	ns
$\overline{BUSAK}$ High to Output Buffer On	t_{BAA}	0	80	0	80	0	80	Vcc = 2.7 to 3.6 V	ns

Note 1: Even if the $\overline{BUSRQ}$ Signal goes Low, the bus will not be released while the $\overline{WAIT}$ signal is Low. The bus will only be released when $\overline{BUSRQ}$ goes Low while $\overline{WAIT}$ is High.

Note 2: This line shows only that the output buffer is in the Off state.
It does not indicate that the signal level is fixed.
Just after the bus is released, the signal level set before the bus was released is maintained dynamically by the external capacitance. Therefore, to fix the signal level using an external resister during bus release, careful design is necessary, since fixing of the level is delayed.
The internal programmable pull-up/pull-down resistor is switched between the Active and Non-Active states by the internal signal.

4.10 Recommended Oscillation Circuit

The TMP91FY12AF has been evaluated by the following resonator manufacturer. The evaluation results are shown below for your information.

Note: The load capacitance of the oscillation terminal is the sum of the load capacitances of C1 and C2 to be connected and the stray capacitance on the board. Even if the ratings of C1 and C2 are used, the load capacitance varies with each board and the oscillator may malfunction. Therefore, when designing a board, make the pattern around the oscillation circuit shortest. It is recommended that final evaluation of the resonator be performed on the board.
