

CDC330 CLOCK DRIVER WITH 3-STATE OUTPUTS

SCAS329A – OCTOBER 1993 – REVISED MARCH 1994

- Low Output Skew, Low Pulse Skew for Clock-Distribution and Clock-Generation Applications
- TTL-Compatible Inputs and Outputs
- Two Banks Distribute One Clock Input to Three Same-Frequency Clock Outputs
- One Bank Distributes One Clock Input to Four Half-Frequency Clock Outputs
- Internal Power-Up Circuit
- Distributed V_{CC} and Ground Pins Reduce Switching Noise
- Symmetrical Output Drive ($-32\text{-mA } I_{OH}$, $32\text{-mA } I_{OL}$)
- State-of-the-Art *EPIC-II B*™ BiCMOS Design Significantly Reduces Power Dissipation
- Packaged in Plastic Small-Outline Package

description

The CDC330 is a high-performance, low-skew clock driver. It is specifically designed for applications requiring output signals at both the primary clock frequency and one-half the primary clock frequency.

This device contains two banks that fan out one input to three same-frequency outputs and one bank that fans out one input to four half-frequency outputs with minimum skew for clock distribution. Each bank of Y outputs switch in phase and at the same frequency as its clock (A) input. The four Q outputs switch at one-half the frequency of their clock ($2\bar{A}$) input.

When the output-enable ($2\overline{OE}$) input is low and the preset ($\overline{PRE}$) input is high, the Q outputs toggle on high-to-low transitions of $2\bar{A}$. Taking $\overline{PRE}$ low asynchronously presets the Q outputs to the high level. When a bank's $\overline{OE}$ input is high, the outputs are in the high-impedance state.

The CDC330 is characterized for operation from 0°C to 70°C .

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC}	–0.5 V to 7 V
Input voltage range, V_I (see Note 1)	–0.5 V to 7 V
Voltage range applied to any output in the disabled or power-off state, V_O	–0.5 V to 5.5 V
Current into any output in the low state, I_O	96 mA
Input clamp current, I_{IK} ($V_I < 0$)	–18 mA
Output clamp current, I_{OK} ($V_O < 0$)	–50 mA
Maximum power dissipation at $T_A = 55^\circ\text{C}$ (in still air) (see Note 2)	1.6 W
Storage temperature range, T_{stg}	–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
2. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils. For more information, refer to the *Package Thermal Considerations* application note in the 1994 *ABT Advanced BiCMOS Technology Data Book*, literature number SCBD002B.

PARAMETER MEASUREMENT INFORMATION

- NOTES:
- C_L includes probe and jig capacitance.
 - All input pulses are supplied by generators having the following characteristics: $PRR \leq 10 \text{ MHz}$, $Z_O = 50 \Omega$, $t_r \leq 2.5 \text{ ns}$, $t_f \leq 2.5 \text{ ns}$.
 - Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
 - The outputs are measured one at a time with one transition per measurement.

PARAMETER MEASUREMENT INFORMATION

NOTES: A. Output skew, $t_{sk(o)}$, is calculated as the greater of:

- The difference between the fastest and slowest of t_{PLHn} ($n = 1, 2, 3$)
- The difference between the fastest and slowest of t_{PLHn} ($n = 4, 5, 6, 7$)
- The difference between the fastest and slowest of t_{PLHn} ($n = 8, 9, 10$)
- The difference between the fastest and slowest of t_{PHLn} ($n = 1, 2, 3$)
- The difference between the fastest and slowest of t_{PHLn} ($n = 4, 5, 6, 7$)
- The difference between the fastest and slowest of t_{PHLn} ($n = 8, 9, 10$)

B. Process skew, $t_{sk(pr)}$, is calculated the same as output skew, $t_{sk(o)}$, across multiple CDC330 devices under identical operating conditions.
