

Features

- Six high-side and six low-side drivers
- Outputs freely configurable as switch, half bridge or H-bridge
- Capable to switch all kinds of loads such as DC motors, bulbs, resistors, capacitors and inductors
- 0.6 A continuous current per switch
- Low-side: $R_{DSon} < 1.5 \Omega$ vs. total temperature range
- High-side: $R_{DSon} < 2.0 \Omega$ vs. total temperature range
- Very low quiescent current $I_s < 20 \mu A$ in standby mode
- Outputs short-circuit protected
- Overtemperature prewarning and protection
- Undervoltage protection
- Various diagnosis functions such as shorted output, open load, overtemperature and power supply fail
- Serial data interface
- Operation voltage up to 40 V
- Daisy chaining possible
- Loss of ground protection
- SO28 power package

Description

The T6816 is a fully protected driver interface designed in 0.8- μm BCDMOS technology. It is especially suitable for truck or bus applications and the industrial 24-V supply. It controls up to 12 different loads via a 16-bit dataword.

Each of the 6 high-side and 6 low-side drivers is capable to drive currents up to 600 mA. The drivers are freely configurable and can be controlled separately from a standard serial data interface. Therefore, all kinds of loads such as bulbs, resistors, capacitors and inductors can be combined. The IC is also designed to easily build H-bridges to drive DC motors in motion-control applications.

Protection is guaranteed in terms of short-circuit conditions, overtemperature and undervoltage. Various diagnosis functions and a very low quiescent current in standby mode open a wide range of applications.

Overvoltage protection is matched to the requirements of the 24-V industrial voltage and the 24-V automotive supply. Automotive qualification referring to conducted interferences, EMC protection and 2-kV ESD protection gives added value and enhanced quality for the exacting requirements of automotive applications.

40-V Dual Hex Output Driver with Serial Input Control

T6816

Rev. A3, 06-Nov-01

Pin Configuration

Figure 2. Pinning SO28

Pin Description

Pin	Symbol	Function
1	LS5	Low-side driver output 5; Power-MOS open drain with internal reverse diode; short-circuit protection; diagnosis for short and open load
2	HS5	High-side driver output 5; Power-MOS open drain with internal reverse diode; short-circuit protection; diagnosis for short and open load
3	HS4	High-side driver output 4; see Pin 2
4	LS4	Low-side driver output 4; see Pin 1
5	VS	Power supply output stages HS4, HS5, HS6, internal supply; external connection to Pin 10 necessary
6, 7, 8, 9	GND	Ground; reference potential; internal connection to Pin 20 - 23; cooling tab
10	VS	Power supply output stages HS1, HS2 and HS3
11	LS3	Low-side driver output 3; see Pin 1
12	HS3	High-side driver output 3; see Pin 2
13	HS2	High-side driver output 2; see Pin 2
14	LS2	Low-side driver output 2; see Pin 1
15	HS1	High-side driver output 1; see Pin 2
16	LS1	Low-side driver output 1; see Pin 1
17	INH	Inhibit input; 5 V logic input with internal pull down; low = standby, high = normal operating
18	DO	Serial data output; 5 V CMOS logic level tristate output for output (status) register data; sends 16-bit status information to the ∞ C (LSB is transferred first). Output will remain tristated unless device is selected by CS = low, therefore, several ICs can operate on one data output line only.
19	VCC	Logic supply voltage (5 V)
20, 21, 22, 23	GND	Ground; see Pin 6 – 9
24	CS	Chip select input; 5 V CMOS logic level input with internal pull up; low = serial communication is enabled, high = disabled
25	CLK	Serial clock input; 5 V CMOS logic level input with internal pull down; controls serial data input interface and internal shift register ($f_{\max} = 2$ MHz)
26	DI	Serial data input; 5 V CMOS logic level input with internal pull down; receives serial data from the control device; DI expects a 16-bit control word with LSB being transferred first
27	LS6	Low-side driver output 6; see Pin 1
28	HS6	High-side driver output 6; see Pin 2

Functional Description

Serial Interface

Data transfer starts with the falling edge of the CS signal. Data must appear at DI synchronized to CLK and are accepted on the falling edge of the CLK signal. LSB (bit 0, SRR) has to be transferred first. Execution of new input data is enabled on the rising edge of the CS signal. When CS is high, Pin DO is in tristate condition. This output is enabled on the falling edge of CS. Output data will change their state with the rising edge of CLK and stay stable until the next rising edge of CLK appears. LSB (bit 0, TP) is transferred first.

Figure 3. Data transfer input data protocol

Input data protocol

Bit	Input Register	Function
0	SRR	Status register reset (high = reset; the bits PSF, SCD and overtemperature shutdown in the output data register are set to low)
1	LS1	Controls output LS1 (high = switch output LS1 on)
2	HS1	Controls output HS1 (high = switch output HS1 on)
3	LS2	See LS1
4	HS2	See HS1
5	LS3	See LS1
6	HS3	See HS1
7	LS4	See LS1
8	HS4	See HS1
9	LS5	See LS1
10	HS5	See HS1
11	LS6	See LS1
12	HS6	See HS1
13	OLD	Open load detection (low = on)
14	SCT	Programmable time delay for short circuit (shutdown delay high / low = 12 ms / 1.5 ms)
15	SI	Software inhibit; low = standby, high = normal operation (data transfer is not affected by standby function because the digital part is still powered)

Output data protocol

Bit	Output (Status) Register	Function
0	TP	Temperature prewarning: high = warning (overtemperature shutdown see remark below)
1	Status LS1	Normal operation: high = output is on, low = output is off Open-load detection: high = open load, low = no open load (correct load condition is detected if the corresponding output is switched off)
2	Status HS1	Normal operation: high = output is on, low = output is off Open-load detection: high = open load, low = no open load (correct load condition is detected if the corresponding output is switched off)
3	Status LS2	Description see LS1
4	Status HS2	Description see HS1
5	Status LS3	Description see LS1
6	Status HS3	Description see HS1
7	Status LS4	Description see LS1
8	Status HS4	Description see HS1
9	Status LS5	Description see LS1
10	Status HS5	Description see HS1
11	Status LS6	Description see LS1
12	Status HS6	Description see HS1
13	SCD	Short circuit detected: set high, when at least one output is switched off by a short circuit condition
14	INH	Inhibit: this bit is controlled by software (bit SI in input register) and hardware inhibit (Pin 17). High = standby, low = normal operation
15	PSF	Power supply fail: undervoltage at Pin VS detected

Note: Bit 0 to 15 = high: overtemperature shutdown

After power-on reset, the input register has the following status

Bit 15 (SI)	Bit 14 (SCT)	Bit 13 (OLD)	Bit 12 (HS6)	Bit 11 (LS6)	Bit 10 (HS5)	Bit 9 (LS5)	Bit 8 (HS4)	Bit 7 (LS4)	Bit 6 (HS3)	Bit 5 (LS3)	Bit 4 (HS2)	Bit 3 (LS2)	Bit 2 (HS1)	Bit 1 (LS1)	Bit 0 (SRR)
H	H	H	L	L	L	L	L	L	L	L	L	L	L	L	L

Power Supply Fail

In case of undervoltage at Pin VS, an internal timer is started. When the undervoltage delay time (t_{dUV}) programmed by the SCT bit is reached, the power supply fail bit (PSF) in the output register is set and all outputs are disabled. When normal voltage is present again, the outputs are enabled immediately. The PSF bit remains high until it is reset by the SRR bit in the input register.

Open-Load Detection

If the open-load detection bit (OLD) is set to low, a pull-up current for each high-side switch and a pull-down current for each low-side switch is turned on (open-load detection current I_{HS1-6} , I_{LS1-6}). If $V_{VS}-V_{HS1-6}$ or V_{LS1-6} is lower than the open-load detection threshold (open-load condition), the corresponding bit of the output in the output register is set to high. Switching on an output stage with OLD bit set to low disables the open-load function for this output.

Overtemperature Protection

If the junction temperature exceeds the thermal prewarning threshold, $T_{jPW\ set}$, the temperature prewarning bit (TP) in the output register is set. When the temperature falls below the thermal prewarning threshold, $T_{jPW\ reset}$, the bit TP is reset. The TP bit can be read without transferring a complete 16-bit data word: with CS = high to low, the state of TP appears at Pin DO. After the μC has read this information, CS is set high and the data transfer is interrupted without affecting the state of the input and output registers.

If the junction temperature exceeds the thermal shutdown threshold, $T_{j\ switch\ off}$, the outputs are disabled and all bits in the output register are set high. The outputs can be enabled again when the temperature falls below the thermal shutdown threshold, $T_{j\ switch\ on}$, and when a high has been written to the SRR bit in the input register. Thermal prewarning and shutdown threshold have hysteresis.

Short-Circuit Protection

The output currents are limited by a current regulator. Current limitation takes place when the overcurrent limitation and shutdown threshold (I_{HS1-6} , I_{LS1-6}) are reached. Simultaneously, an internal timer is started. The shorted output is disabled when during a permanent short the delay time (t_{dSd}) programmed by the short-circuit timer bit (SCT) is reached. Additionally, the short-circuit detection bit (SCD) is set. If the temperature prewarning bit TP in the output register is set during a short, the shorted output is disabled immediately and SCD bit is set. By writing a high to the SRR bit in the input register, the SCD bit is reset and the disabled outputs are enabled.

Inhibit

There are two ways to inhibit the T6816:

1. Set bit SI in the input register to zero
2. Switch Pin 17 (INH) to 0 V

In both cases, all output stages are turned off but the serial interface stays active. The output stages can be activated again by bit SI = 1 or by Pin 17 (INH) switched back to 5 V

Absolute Maximum Ratings

All values refer to GND pins

Parameter	Symbol	Value	Unit

Output DO: High level = $0.8 \times V_{CC}$, low level = $0.2 \times V_{CC}$

Application Circuit

Figure 5.

Application Notes

It is strongly recommended to connect the blocking capacitors at V_{CC} and V_S as close as possible to the power supply and GND pins.

Recommended value for capacitors at V_S :
electrolytic capacitor $C > 22 \mu F$ in parallel with a ceramic capacitor $C = 100 \text{ nF}$. Value for electrolytic capacitor depends on external loads, conducted interferences and reverse conducting current I_{HSX} (see: Absolut Maximum Ratings).

Recommended value for capacitors at V_{CC} :
electrolytic capacitor $C > 10 \mu F$ in parallel with a ceramic capacitor $C = 100 \text{ nF}$.

To reduce thermal resistance it is recommended to place cooling areas on the PCB as close as possible to GND pins.

Ozone Depleting Substances Policy Statement

It is the policy of **Atmel Germany GmbH** to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

Atmel Germany GmbH has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

Atmel Germany GmbH can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.
