

**GENERAL DESCRIPTION**

The ICS83054I-01 is a 4-bit, 2:1, Single-ended Multiplexer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The ICS83054I-01 has two selectable single-ended clock inputs and four single-ended clock outputs.

The output has a  $V_{DDO}$  pin which may be set at 3.3V, 2.5V, or 1.8V, making the device ideal for use in voltage translation applications. An output enable pin places the output in a high impedance state which may be useful for testing or debug. Possible applications include systems with up to four transceivers which need to be independently set for different rates. For example, a board may have four transceivers, each of which need to be independently configured for 1 Gigabit Ethernet or 1 Gigabit Fibre Channel rates. Another possible application may require the ports to be independently set for FEC (Forward Error Correction) or non-FEC rates. The device operates up to 250MHz and is packaged in a 16 TSSOP.

**FEATURES**

- 4-bit, 2:1 single-ended multiplexer
- Nominal output impedance:  $15\Omega$  ( $V_{DDO} = 3.3V$ )
- Maximum output frequency: 250MHz
- Propagation delay: 2.5ns (typical)
- Input skew: 45ps (typical)
- Part-to-part skew: TBD
- Additive phase jitter, RMS (12KHz - 20MHz): 0.07ps (typical)
- Operating supply modes:  
 $V_{DD}/V_{DDO}$   
 3.3V/3.3V  
 3.3V/2.5V  
 3.3V/1.8V  
 2.5V/2.5V  
 2.5V/1.8V
- -40°C to 85°C ambient operating temperature

The Preliminary Information presented herein represents a product in prototyping or pre-production. The noted characteristics are based on initial product characterization. Integrated Circuit Systems, Incorporated (ICS) reserves the right to change any circuitry or specifications without notice.

**TABLE 1. PIN DESCRIPTIONS**

Number	Name	Type		Description
1, 6 11, 16	SEL3, SEL2, SEL1, SEL0	Input	Pulldown	Clock select inputs. See Control Input Function Table. LVCMOS / LVTTTL interface levels.
2, 5, 9, 12, 15	Q3, Q2, Q1, Q0	Output		Single-ended clock output. LVCMOS/LVTTTL interface levels.
3, 14	V <sub>DDO</sub>	Power		Output supply pins.
4, 13	GND	Power		Power supply ground.
7, 10	CLK1, CLK0	Input	Pulldown	Single-ended clock inputs. LVCMOS/LVTTTL interface levels.
8	V <sub>DD</sub>	Power		Core supply pin.
9	OE	Input	Pullup	Output enable. When LOW, outputs are in HIGH impedance state. When HIGH, outputs are active. LVCMOS / LVTTTL interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

**TABLE 2. PIN CHARACTERISTICS**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			4		pF
R <sub>PULLUP</sub>	Input Pullup Resistor			51		KΩ
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		KΩ
C <sub>PD</sub>	Power Dissipation Capacitance (per output)			11		pF
R <sub>OUT</sub>	Output Impedance			15		Ω

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{DD}$	4.6V
Inputs, $V_I$	-0.5V to $V_{DD} + 0.5 V$
Outputs, $V_O$	-0.5V to $V_{DDO} + 0.5V$
Package Thermal Impedance, $\theta_{JA}$	89°C/W (0 lfpm)
Storage Temperature, $T_{STG}$	-65°C to 150°C

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in

the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues. The primary issue relates to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated

above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependant on the input source and measurement equipment.
