## 2. Torque

The range of the torque voltage is as shown below.

	Rotation
$E_C < E_{CR}$	Forward Rotation
$E_C > E_{CR}$	Stop after Detecting Reverse Rotation

The GEC is determinated by RNF  
(Where GEC :  $E_C - R_{NF}$  gain)

$$G_{EC} = 0.255/R_{NF} \text{ [A/V]}$$

Torque limit current  $I_{TL}$

$$I_{TL} = 0.35/R_{NF} \text{ [A]}$$

## 4. REVERSE ROTATION PREVENTION

**Fig-17.**

- 1) The forward and the reverse rotation of the motor are detected, as shown in the below Table, by the circuit as shown in the above. Consequently at eh reverse rotation, the output Q becomes LOW and cuts off the output of the Current Sense Amp, resulting in the stoppage of the Gain Controller function.
- 2) When the CD is rotating in the forward direction,  $E_C > E_{CR}$  is sometimes controlled to retard and/or to stop the CD. As the controlling time of  $E_C > E_{CR}$  gets longer, CD slows down, stops, and then rotates in the reverse direction. To prevent the CD from rotating in the reverse direction, a reverse rotation resistant function is required. Its operational principles are discussed in □ 5ROTATIONAL DIRECTION DETECTION□ , and are summarized in the below.

Rotation	H2	H3	D-E/F (Q)	Reverse Rotation Preventer	
				$E_C < E_{CR}$	$E_C > E_{CR}$
Forward	H	H→L	H	Forward	Brake and Stop
Reverse	L	L→H	L	Breaks and Stop

## 6. SHORT BRAKE

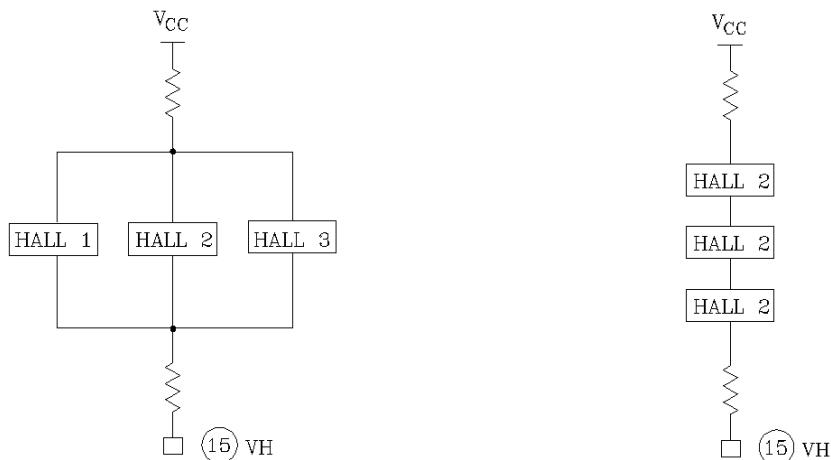

**Fig-19.**

Pin #18	Short Brake
HIGH	ON
LOW	OFF

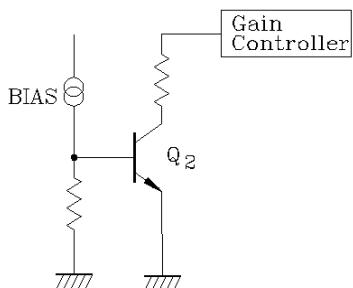

When the pick-up part moves from the inner to the outer spindle of the CD, the Brake function of the reverse voltage is commonly employed to retard the rotative velocity of the reverse voltage may produce much heat at Drive IC. To remove these shortcomings and to enhance the efficiency, the short breaks function is added to when short brake function is active, all upper Power TRs turn off and all Lower Power TRs turn on, so as to make the rotative velocity of the Motor slow down.

## 7. HALL SENSOR CONNECTION

**Fig-20.**

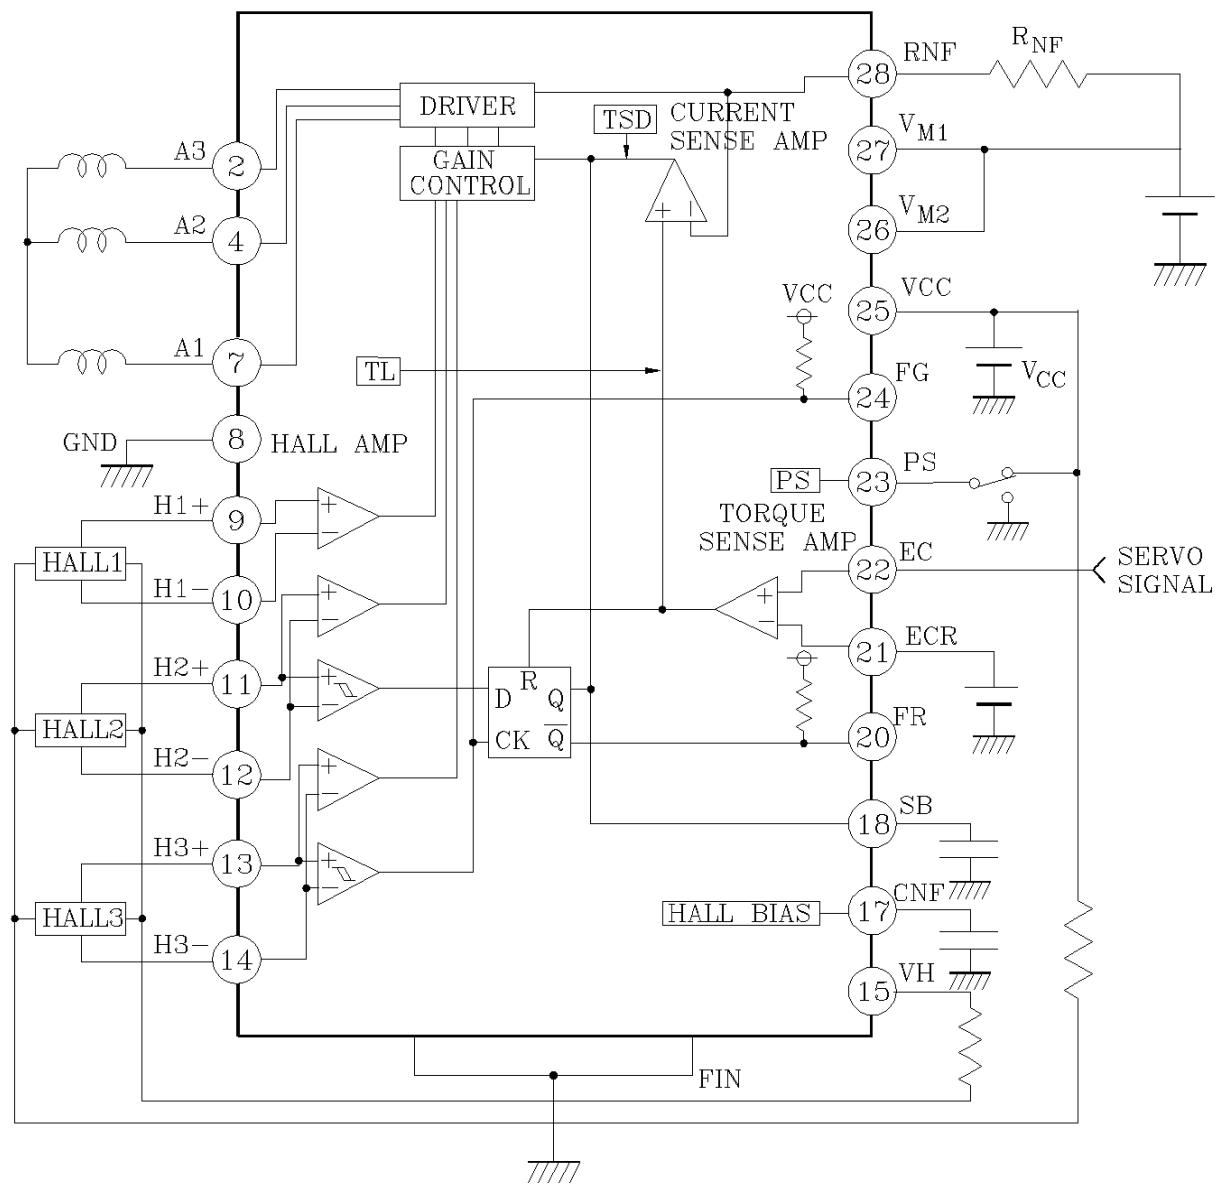

## 8. TSD (Thermal Shutdown)

When the chip temperature rises up to about 175°C then the Q2 would turn on so the output driver will be shutdown, and then when the chip temperature falls off to about 160°C then the Q2 would turn off so the driver will be normally operated. It has the temperature Hysteresis of about 15°C
