

- Ideal for 325 MHz Remote-Control Transmitters
- Very Low Series Resistance
- Quartz Stability
- Surface-Mount, Ceramic Case with 21 mm<sup>2</sup> Footprint
- Complies with Directive 2002/95/EC (RoHS)

The RO2081A is a true one-port, surface-acoustic-wave (SAW) resonator in a surface-mount ceramic case. It provides reliable, fundamental-mode, quartz frequency stabilization of fixed-frequency oscillators and low power AM transmitters operating at 325 MHz. Typical applications include remote-control and wireless security alarms for us in Israel.

#### **Absolute Maximum Ratings**

| Rating   | Value      | Units |  |  |  |  |  |
|--|------------|-------|--|--|--|--|--|
| CW RF Power Dissipation                                | +0         | dBm   |  |  |  |  |  |
| DC Voltage Between Terminals (Observe ESD Precautions) | ±30        | VDC   |  |  |  |  |  |
| Case Temperature                                       | -40 to +85 | °C    |  |  |  |  |  |
| Soldering Temperature (10 seconds / 5 cycles max.)     | 260        | °C    |  |  |  |  |  |

# T

# CAUTION: Electrostatic Sensitive Device. Observe precautions for handling. Notes:

- Frequency aging is the change in f<sub>C</sub> with time and is specified at +65°C or less.
  Aging may exceed the specification for prolonged temperatures above +65°C.
   Typically, aging is greatest the first year after manufacture, decreasing in subsequent years.
- 2. The center frequency,  $f_C$ , is measured at the minimum insertion loss point,  $IL_{MIN}$ , with the resonator in the 50  $\Omega$  test system (VSWR  $\leq$  1.2:1). The shunt inductance,  $L_{TEST}$ , is tuned for parallel resonance with  $C_O$  at  $f_C$ . Typically,  $f_{OS-CILLATOR}$  or  $f_{TRANSMITTER}$  is approximately equal to the resonator  $f_C$ .
- One or more of the following United States patents apply: 4,454,488 and 4,616,197.
- Typically, equipment utilizing this device requires emissions testing and government approval, which is the responsibility of the equipment manufacturer.
- 5. Unless noted otherwise, case temperature  $T_C = +25^{\circ}C \pm 2^{\circ}C$ .
- 6. The design, manufacturing process, and specifications of this device are subject to change without notice.
- Derived mathematically from one or more of the following directly measured parameters: f<sub>C</sub>, IL, 3 dB bandwidth, f<sub>C</sub> versus T<sub>C</sub>, and C<sub>O</sub>.

- Turnover temperature, T<sub>O</sub>, is the temperature of maximum (or turnover) frequency, f<sub>O</sub>. The nominal frequency at any case temperature, T<sub>C</sub>, may be calculated from: f = f<sub>O</sub> [1 FTC (T<sub>O</sub> -T<sub>C</sub>)<sup>2</sup>]. Typically oscillator T<sub>O</sub> is approximately equal to the specified resonator T<sub>O</sub>.
- 9. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance  $C_O$  is the static (nonmotional) capacitance between the two terminals measured at low frequency (10 MHz) with a capacitance meter. The measurement includes parasitic capacitance with "NC" pads unconnected. Case parasitic capacitance is approximately 0.05 pF. Transducer parallel capacitance can by calculated as:  $C_P \approx C_O 0.05$  pF.

# SAW Resonator

### **Electrical Connections**

The SAW resonator is bidirectional and may be installed with either orientation. The two terminals are interchangeable and unnumbered. The callout NC indicates no internal connection. The NC pads assist with mechanical positioning and stability. External grounding of the NC pads is recommended to help reduce parasitic capacitance in the circuit

## **Typical Test Circuit**

The test circuit inductor,  $L_{\text{TEST}}$ , is tuned to resonate with the static capacitance,  $C_{\text{O}}$ , at  $F_{\text{C}}$ .

#### **POWER TEST**

CW RF Power Dissipation = P<sub>INCIDENT</sub> - P<sub>REFLECTED</sub> **Typical Application Circuits** 

### Typical Low-Power Transmitter Application

### **Equivalent LC Model**

### **Temperature Characteristics**

The curve shown on the right accounts for resonator contribution only and does not include LC component temperature contributions.

# Typical Circuit Board Land Pattern

The circuit board land pattern shown below is one possible design. The optimum land pattern is dependent on the circuit board assembly process which varies by manufacturer. The distance between adjacent land edges should be at a maximum to minimize parasitic capacitance. Trace lengths from terminal lands to other components should be short and wide to minimize parasitic series inductances.

## **Case Design**

The case material is black alumina with contrasting symbolization. All pads are nominally centered with respect to the base and consist of 40 to 70 microinches electroless gold on 60-350 microinches electroless nickel.
