

28V, 100mA, Low-Quiescent-Current LDO with Reset and Power-Fail Input/Output

General Description

The MAX5091 high-voltage linear regulator is designed to operate from a +5V to +28V input voltage, and withstands up to 40V transients. The device consumes only 45 μ A of quiescent current at 100 μ A output current. The MAX5091 delivers up to 100mA of output current with low 50mV maximum dropout voltage. The MAX5091 provides an active-low open-drain microprocessor RESET output. The reset timeout period is programmable and can be set with an external capacitor. The MAX5091 includes an uncommitted comparator for input voltage monitoring/power-fail indication. The device is available with a fixed +5V (MAX5091A) or +3.3V (MAX5091B) output. The MAX5091 is short-circuit protected and includes thermal shutdown.

The MAX5091 operates over the -40°C to +125°C automotive temperature range and is available in 8-pin, thermally enhanced TDFN and SO-EP packages.

Applications

Automotive
Industrial

Telecom/Networking

Features

- ◆ +5V to +28V Wide Operating Input Voltage Range
- ◆ Withstands 40V Input Voltage Transients
- ◆ Guaranteed 100mA Output Current
- ◆ 45 μ A Typical Quiescent Current at 100 μ A Output Current
- ◆ Preset +5V (MAX5091A) or +3.3V (MAX5091B) Output Voltage
- ◆ Stable with Only 10 μ F Output Capacitance
- ◆ RESET Output with Adjustable Timeout Period
- ◆ Uncommitted Comparator for Voltage Monitoring/Power-Fail Indication
- ◆ Output Overload and Short-Circuit Protection
- ◆ Thermal Shutdown
- ◆ Available in 8-Pin TDFN (1.95W at T_A = +70°C) and 8-Pin SO (1.5W at T_A = +70°C)
- ◆ Operates Over -40°C to +125°C Automotive Temperature Range

Pin Description

PIN	NAME	FUNCTION
1	V_S	Regulator Input. Operating supply range is from +5V to +28V and withstands 40V transients. Bypass V_S to GND with a 10 μF capacitor.
2	SI	Voltage Sense/Power-Fail Comparator Input. SI is the noninverting input of an uncommitted comparator. SO asserts low if V_{SI} drops below the reference level, V_{ST} .
3	EN	Enable Input. Leave unconnected (or pull EN high) to turn on the regulator. Pull EN low to place the device in shutdown mode. EN is internally pulled up to 3.6V.
4	CT	Reset Timeout Delay Capacitor Connection. Connect a capacitor from CT to GND to program the reset timeout period/reset pulse delay. During regulation, CT is pulled up to V_{OUT} . CT is pulled low during reset, when EN is low, or when in thermal shutdown.
5	GND	Ground. Bypass the input and output capacitors to the GND plane. Solder to large pads or the circuit-board ground plane to maximize thermal dissipation.
6	\overline{RES}	Active-Low Reset Output. Pull up externally to V_{OUT} . Open-drain \overline{RES} goes low when V_{OUT} is below the reset threshold. Once output voltage is in regulation, \overline{RES} goes high after the programmed reset timeout period is over. \overline{RES} is low when EN is low or in thermal shutdown.
7	SO	Voltage Sense/Power-Fail Comparator Output. Pull up externally to V_{OUT} . Open-drain SO asserts low when V_{SI} drops below the reference level, V_{ST} . SO also asserts low when EN is low or in thermal shutdown.
8	V_{OUT}	Regulator Output. Fixed at +5V (MAX5091A) or +3.3V (MAX5091B). Bypass with a 10 μF ceramic capacitor to GND.
EP	EP	Exposed Paddle. EP is internally connected to GND. Connect EP to GND to provide a low thermal-resistance path from the IC junction to the PC board. Do not use as the only electrical connection to GND.

28V, 100mA, Low-Quiescent-Current LDO with Reset and Power-Fail Input/Output

Detailed Description

Regulator

The MAX5091 high-voltage, LDO regulator operates from +5V to +28V input voltage. The device withstands up to 40V transients, providing protection against temporary overvoltage conditions like load dump. The MAX5091 incorporates internal feedback resistors for factory-preset voltages of either +5V (MAX5091A) or +3.3V (MAX5091B). The regulator is capable of driving up to 100mA of load current and features a typical current limit of 260mA. The regulator uses a pnp pass element and provides low 0.5V dropout while delivering 100mA load current. The output of the regulator follows closely to the input during turn-on. See the Output Voltage vs. Input Voltage graph in the *Typical Operating Characteristics*. This makes the usable input voltage range for 3.3V and 5V output down to 3.7V and 5.5V, respectively. The MAX5091 is designed to operate with very low quiescent current during always-on operation when not in dropout. The regulator is stable with a wide variety of capacitors including low-ESR ceramic 10 μ F (0603 case size). The load-transient response curves depict the stability of the LDO when using different capacitance and ESR ranges. See the *Capacitor Selection and Regulator Stability* section in the *Applications Information*.

Reset Output (\overline{RES})

The MAX5091 integrates a power-on-reset circuit. \overline{RES} is an open-drain output that requires a pullup resistor to V_{OUT} . The open-drain MOSFET can sink up to 825 μ A current while keeping the \overline{RES} voltage below 0.4V. The internal reset circuit monitors the regulator output voltage and \overline{RES} asserts an active-low output when the regulator output falls below a reset threshold of typically $0.9 \times V_{OUT}$. The \overline{RES} output remains low when V_{OUT} is below the reset threshold, and remains low for the duration of the reset timeout period (t_{RD}). The reset timeout period is programmable and can be set with an external capacitor connected from CT to ground. The duration of the delay as a function of CT is:

$$t_{RD} = \frac{C_{CT} \times V_{CCTH}}{I_{CT}} + (35 \times 10^{-6})$$

where $V_{CCTH} = 2.1V$ and $I_{CT} = 2 \times 10^{-6}A$.

The default reset timeout period is 35 μ s when no capacitor is connected from CT to ground.

SI/SO Comparator

The MAX5091 includes an uncommitted comparator for monitoring the input voltage or for detecting power-fail conditions. The input SI is the noninverting input of the comparator. The open-drain output SO asserts low when voltage at the input SI drops below the threshold voltage, V_{ST} (see Figure 1). The sense comparator typically has a hysteresis of 100mV. Use the following equation to calculate the resistor-divider for programming the trip voltage (V_{TRIP}) during power-fail. See the *Typical Application Circuit*.

$$V_{TRIP} = \frac{(V_{ST} \times R_H)}{R_L} + V_{ST}$$

where $V_{ST} = 1.16V$ (typ). Choose R_L between 100k Ω to 300k Ω .

Enable Input

The enable (EN) is a TTL-compatible logic input. Logic low at EN turns off the regulator and reduces the current consumption to 17 μ A (typ). It is internally pulled up to a logic-high voltage (3.6V max) by an internal resistor. Thus, the MAX5091 is enabled by default when V_S is applied and EN is left unconnected. The regulator, reset supervisor circuit, and the sense comparator can be manually shut down by pulling EN low. For shutdown operation, the pulldown network must be capable of sinking 3 μ A max, since the internal pullup resistor sets the maximum pullup current at 3 μ A. The external pulldown device should not leak more than 1 μ A current when it is in the off-state.

Current Limit

The MAX5091 features a current limiter that monitors the output current and controls the pass transistor's gate voltage, limiting the output current to typically 260mA. The output can be continuously shorted to ground without damaging the device at $V_S \leq 16V$. Note that the output short-circuit current may increase the power dissipation significantly and raise the junction temperature to its thermal-shutdown threshold. In such a case, the MAX5091 is temporarily turned off.

Thermal Shutdown

When the junction temperature exceeds $T_J = +165^\circ C$ (typ), an internal thermal sensor signals the shutdown logic to turn off the pass transistor and allow the IC to cool. The thermal sensor turns the pass transistor on again after the IC's junction temperature cools by +20 $^\circ C$ (typ), resulting in a cycled output during continuous thermal-overload conditions. Thermal shutdown protects the MAX5091 in the event of fault conditions. For continuous operation, do not exceed the absolute maximum junction temperature of $T_J = +150^\circ C$.

28V, 100mA, Low-Quiescent-Current LDO with Reset and Power-Fail Input/Output

Applications Information

Available Output Current Calculation

The MAX5091 high-voltage regulator provides up to 100mA of output current. The input voltage extends to +28V. Package power dissipation limits the amount of output current available for a given input/output voltage and ambient temperature. Figure 2 depicts the maximum power dissipation curve for the 8-pin SO-EP package. The graph assumes that the exposed metal back of the MAX5091 package is soldered to copper on a single layer PCB according to the JEDEC51 standard.

Use Figure 2 to determine the allowable package dissipation for a given ambient temperature. Alternately, use the following formula to calculate the allowable package dissipation:

$$P_D = \begin{cases} 1.538W & \text{For } T_A \leq +70^\circ C \\ 1.538 - 0.01923(T_A - 70^\circ C) & \text{For } +70^\circ C < T_A \leq +125^\circ C \end{cases}$$

After determining the allowable package dissipation, calculate the maximum output current using the following formula:

$$I_{OUT(MAX)} \cong \frac{P_D}{V_S - V_{OUT}}$$

The above equations do not include the power dissipation from self-heating due to the IC ground current.

The junction-to-ambient thermal impedance depends on the area of the copper plane, its thickness, and the number of copper layers on PCB. For the higher power dissipation requirement, use multiple-layered PCBs with 2oz copper and a large copper area.

Capacitor Selection and Regulator Stability

For stable operation over the full temperature range and with load currents up to 100mA, use a 10µF output capacitor with a low ESR. Table 1 shows a list of recommended output capacitor ESR for various load conditions.

Figure 2. 8-Pin SO-EP Maximum Power Dissipation vs. Temperature

Table 1. Recommended Output Capacitor ESR

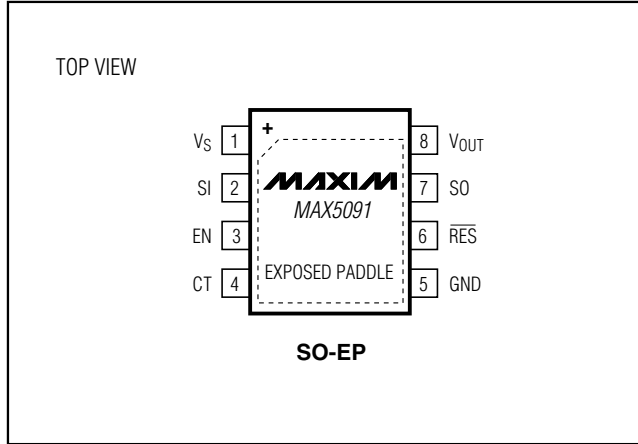

RECOMMENDED C _{OUT} ESR		
I _{OUT}	V _{OUT} = 3.3V	V _{OUT} = 5.0V
I _{OUT} ≤ 10mA	C _{ESR} < 0.66Ω	C _{ESR} < 1Ω
I _{OUT} ≤ 50mA	C _{ESR} < 0.132Ω	C _{ESR} < 0.2Ω
I _{OUT} ≤ 100mA	C _{ESR} < 66mΩ	C _{ESR} < 0.1Ω

NOTES:

- ALL DIMENSIONS ARE IN mm. ANGLES IN DEGREES.
- COPLANARITY SHALL NOT EXCEED 0.08 mm.
- WARPAGE SHALL NOT EXCEED 0.10 mm.
- PACKAGE LENGTH/PACKAGE WIDTH ARE CONSIDERED AS SPECIAL CHARACTERISTIC(S).
- DRAWING CONFORMS TO JEDEC MO229, EXCEPT DIMENSIONS "D2" AND "E2", AND T1433-1 & T1433-2.
- "N" IS THE TOTAL NUMBER OF LEADS.
- NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
-  MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.

-DRAWING NOT TO SCALE-

		
TITLE: PACKAGE OUTLINE, 6,8,10 & 14L, TDFN, EXPOSED PAD, 3x3x0.80 mm		
APPROVAL	DOCUMENT CONTROL NO. 21-0137	REV. H 2/2

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
