OVERVIEW

The SM6451A is a 3-wire serial-controlled electronic variable volume IC for audio applications. It provides electronic volume control for a stereo system (left and right channels), and independent channel attenuation and muting, with greatly enhanced digital zip noise suppression. The chip address function allows up to four SM6451A devices to be connected and individually controlled over the 3-wire control interface from a single CPU. It is available in 16-pin TSSOP packages.

FEATURES

- Stereo inputs and outputs
- Attenuation function
  - 2-channel independent control
  - 1.0dB/step over 80 steps
  - 0 to −80dB range
- Mute function
- 3-wire serial data control (MDT, MCK, MLEN)
- Chip addressing (up to 4 devices can be connected in parallel)
- Low noise
  - ≤ 0.002% THD + noise
  - 10μVrms residual noise
- 5V single power supply
- Silicon-gate CMOS process
- Package: 16-pin TSSOP (Pb free)

APPLICATIONS

- Audio equipment

MEASUREMENT CIRCUIT

Chip address: ADRS1 = LOW, ADRS2 = LOW
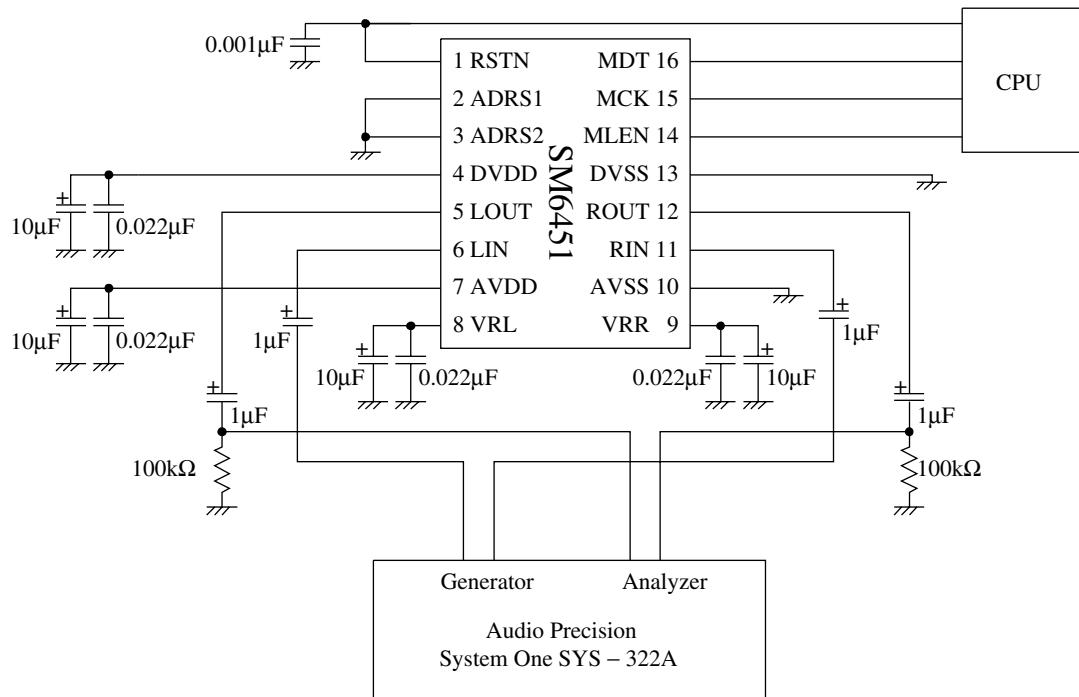

MICROCONTROLLER INTERFACE

The SM6451A uses a 3-wire serial interface comprising MDT (data), MCK (clock) and MLEN (latch enable) to select channels and attenuation levels for the addressed device.

Input Timing

The microcontroller data input timing is shown in figure 1.

MCK
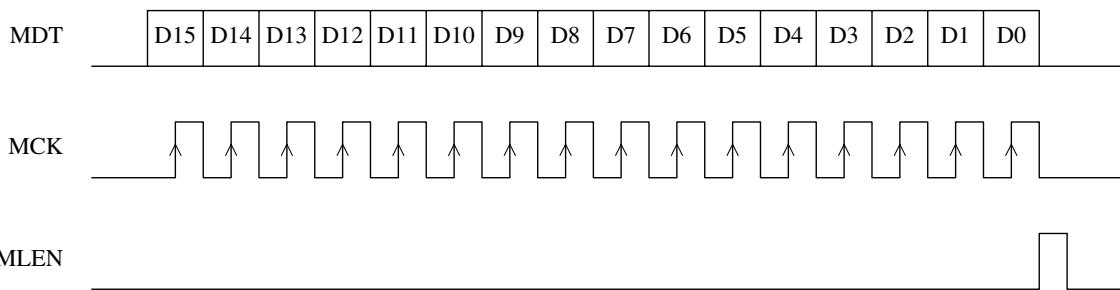

MLEN

Figure 1. Microcontroller data input timing

Data is shifted into the internal shift register on the rising edge of MCK, and the attenuation value is updated on the rising edge of MLEN. Accordingly, data on MDT should be changed on the falling edge of MCK.

Note, however, a minimum of 16 MCK input pulses are required.

Data Format

The format of microcontroller input data is shown in figure 2.

D15, D14

Don't care.

D13, D12

Chip address bits. D13 corresponds to ADRS1 and D12 corresponds to ADRS2. The device is addressed only when ADRS1:ADRS2 matches D13:D12.

Example 1: If D13 = LOW, D12 = HIGH and ADRS1 = LOW, ADRS2 = LOW, then the device is not addressed since ADRS2 and D12 do not match.

Example 2: If D13/D12 = LOW and ADRS1/ADRS2 = LOW, then the device is addressed and all input data is read and the attenuation settings updated.

D11, D10

Don't care.

D9, D8

Channel select bits. The selected channel(s) are shown in table 1.

TYPICAL APPLICATIONS

Connection Guidelines

Decoupling capacitors of approximately 10μF should be connected from AVDD, VRL, VRR to AVSS, and from DVDD to DVSS.

In addition, approximately 0.01μF capacitors should also be connected from AVDD, VRL, VRR to AVSS, and from DVDD to DVSS to suppress digital switch noise.

An approximately 0.001μF capacitor connected from RSTN to DVSS will force a system reset when power is applied.

Connection 1 (to DAC)
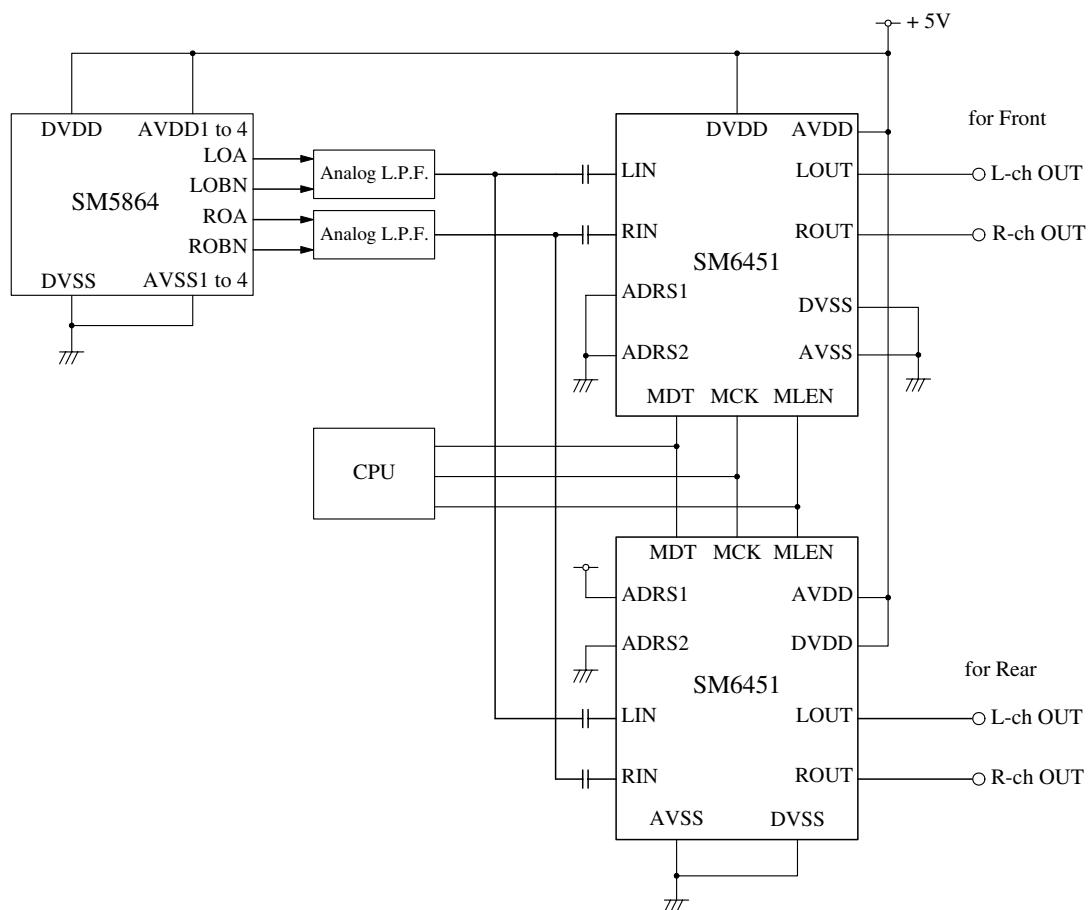

Connection 2
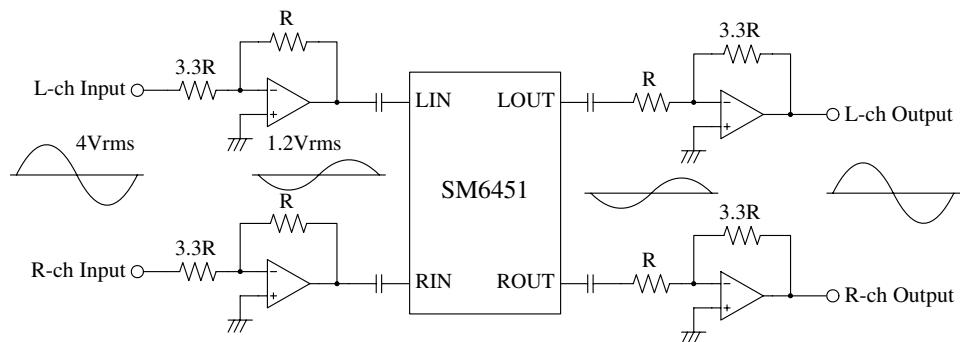

The SM6451A uses a 1.2Vrms input reference amplitude. If the input signal is 4Vrms, then the input must be reduced by a factor of 1/3.3, and the output increased by a factor of 3.3.

Connection 3
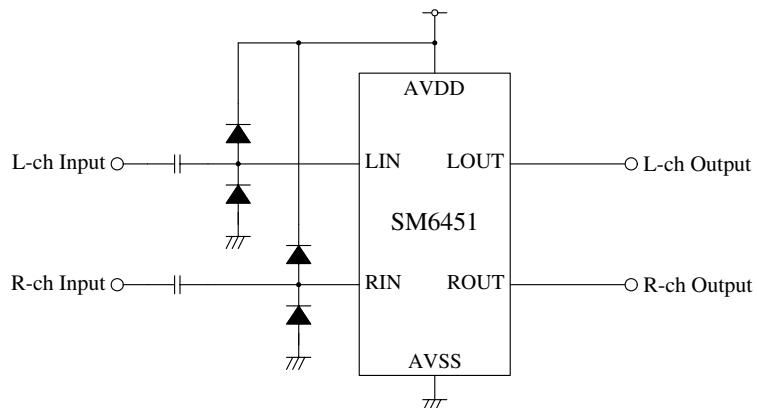

When there is a possibility that the input peak-to-peak amplitude will exceed the supply voltage, input protection diodes should be connected to prevent device breakdown.
