

### **RF2461** CDMA/FM LOW NOISE AMPLIFIER/MIXER 900 MHz DOWNCONVERTER

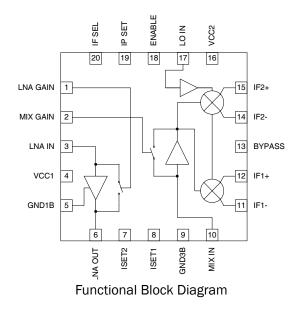

RoHS Compliant & Pb-Free Product Package: QFN, 20-Pin, 4x4

#### **Features**

- Complete Receiver Front-End
- Stepped LNA/Mixer Gain Control
- Adjustable LNA/Mixer Bias Current
- Adjustable LNA/Mixer IIP3
- Meets IMD Tests with Three Gain States/Two Logic Control Lines

#### **Applications**

- CDMA/FM (AMPS) Systems
- Dual-Mode TACS/JCDMA Systems
- General Purpose Downconverter
- Commercial and Consumer Systems
- Portable Battery-Powered Equipment

#### **Product Description**

The RF2461 is a receiver front-end designed for the receive section of dual-mode CDMA/FM cellular applications. It is designed to amplify and downconvert RF signals, while providing 30dB of stepped gain control range. Features include digital control of LNA gain, mixer gain, and power down mode. Another feature of the chip is adjustable IIP3 of the LNA and mixer using an off-chip current setting resistor. Noise figure, IP3, and gain are designed to be compatible with the IS-98B interim standard for CDMA cellular communications. The IC is manufactured on an advanced Silicon Germanium Bi-CMOS process and is assembled in a 4mmx4mm, 20-pin, QFN package.

#### **Ordering Information**

RF2461PCBA-41X Fully Assembled Evaluation Board

#### **Absolute Maximum Ratings**

Parameter	Rating	Unit
Supply Voltage	-0.5 to +5.0	V <sub>DC</sub>
Input LO and RF Levels	+6	dBm
Operating Ambient Temperature	-40 to +85	°C
Storage Temperature	-40 to +150	°C

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

Ultra-Low Gain	0	0	Alternative Lowest Current Mode for IMD Tests 5 and 6

rfmd.com

Pin	Function	Description	Interface Schematic
1	LNA GAIN	Controls the bypass feature of the LNA. A logic low (<1.0V) selects the bypass mode. A logic high (>2.0V) turns on the LNA.	
2	MIX GAIN	Controls the bypass feature of the mixer preamp. A logic low (<1.0V) selects the bypass mode. A logic high (>2.0V) turns on the preamppreamp.	
3	LNA IN	LNA input pin.	
4	VCC1	VCC pin for all circuits except the LO. Buffer/bias circuitry.	
5	GND1B	LNA emitter. This pin provides the DC path to ground for the LNA. A lumped element or a transmission line inductor can be placed between this pin and ground to degenerate the LNA. This will decrease the gain and increase the IP3 of the LNA. As the value of inductance is increased, these effects will become more pronounced.	
6	LNA OUT	LNA output pin.	See pin 3.
7	ISET2	An external resistor R2 connected to this pin sets the current of the preamp and the mixer.	
8	ISET1	An external resistor R3 connected to this pin sets the current of the LNA when IP SET is high (see pin 19).	
9	GND3B	Ground pin for preamp circuit. A 3.3nH inductor is used between pin 9 and ground to degenerate the mixer preamp. Degenerating the preamp will reduce the gain, increase the IP3 and affect the preamp input impedance.	
10	MIX IN	Mixer preamp input pin.	See pin 9.
11	IF1-	Second differential output pin for the first mixer.	See pin 12.
12	IF1+	First differential output pin for the first mixer. Open collector. A current combiner external network performs a differential to single-ended conversion and sets the output impedance. A DC blocking cap must be present if the IF filter input has a DC path to ground. Mixer (IF2+ and IF-) needs to "see" a differential impedance between $2 k\Omega$ to $4 k\Omega$ .	IF1- IF1+
13	BYPASS	Bypass pin for the LO bias reference.	
14	IF2-	Second differential output pin for the second mixer.	See pin 15.

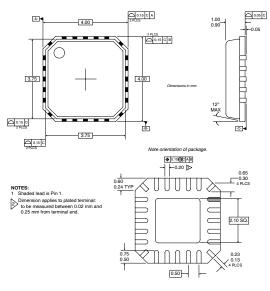

rfmd.com

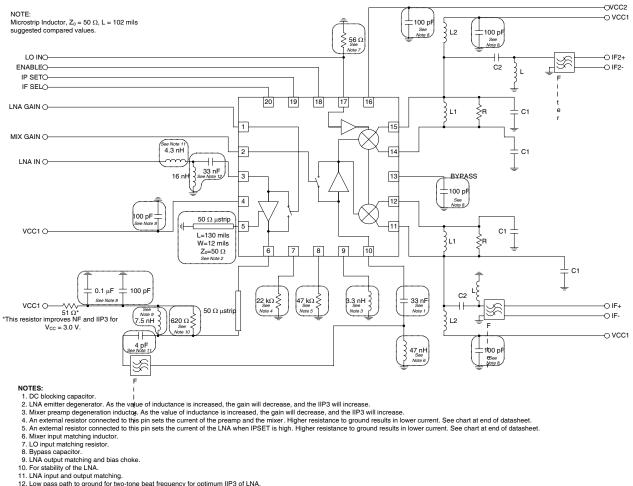

Pin	Function	Description	Interface Schematic
15	IF2+	First differential output pin for the second mixer. Open collector. A current combiner external network performs a differential to single-ended conversion and sets the output impedance. A DC blocking cap must be present if the IF filter input has a DC path to ground. Mixer (IF2+ and IF2-) needs to "see" a differential impedance between $2k\Omega$ to $4k\Omega$ .	IF2- IF2+ IF2+ IF2+ IF2+
16	VCC2	VCC pin for the LO buffer/bias circuitry.	
17	LO IN	LO limiter input pin.	
18	ENABLE	This pin is used to enable or disable the RF2461. A logic high (>2.0V) enables the circuitry. A logic low (<1.0V) disables the circuitry.	
19	IP SET	Controls the setting of the LNA current. A logic low (<1.0V) selects the internal resistance (49.5k $\Omega$ ), resulting in an LNA current of 5mA. A logic high (>2.0V) selects the external resistance at pin 8.	
20	IF SEL	Determines which IF port is active. A logic low (<1.0V) activates IF1 and deactivates IF2. A logic high (>2.0V) activates IF2 and deactivates IF1. Mixers are identical. Either IF output may be used for CDMA or AMPS applications.	
Pkg Base	GND	Ground connection. The backside of the package should be soldered to a top side ground pad which is connected to the ground plane with multiple vias.	

# Package Drawing QFN, 20-PIN, 4x4

### **Application Schematic**

12. Low pass path to ground for two-tone beat frequency for optimum IIP3 of LNA.

#### **Output Interface Network**

L1, C1, and R form a current combiner which performs a differential to single-ended conversion at the IF frequency and sets the output impedance. In most cases, the resonance frequency is independent of R and can be set according to the following equation:

$$f_{IF} = \frac{1}{2\pi\sqrt{\frac{L1}{2}(C1 + C_{EQ})}}$$

R can then be used to set the output impedance according to the following equation:

$$R = \left(\frac{1}{4 \cdot R_{OUT}} - \frac{1}{R_{P}}\right)^{-1}$$

where  $R_{OUT}$  is the desired output impedance and  $R_P$  is the parasitic equivalent parallel resistance of L1.

C1 should be chosen as high as possible (not greater than 15 pF), while maintaining an  $\rm R_P$  of L1 that allows for the desired  $\rm R_{OUT}$ .

Where  $\rm C_{EQ}$  is the equivalent stray capacitance and capacitance looking into pins 11 and 12. An average value to use for C\_{EO} is 2.5 pF to 3 pF.

L2 and C2 serve dual purposes. L2 serves as an output bias choke, and C2 serves as a series DC block.

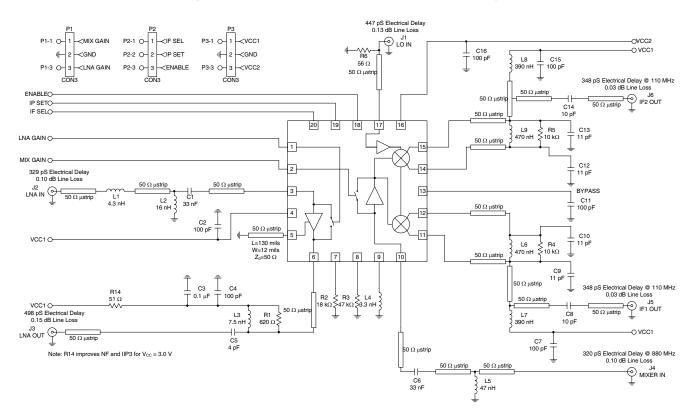

In addition, L2 and C2 may be chosen to form an impedance matching network if the input impedance of the IF filter is not equal to ROUT. Otherwise, L2 is chosen to be large, and C2 is chosen to be large if a DC path to ground is present in the IF filter, or omitted if the filter is DC blocked.
