78P2343JAT
3-port E3/DS3/STS-1 LIU with Jitter Attenuator

DATA SHEET

JULY 2005

DESCRIPTION

The 78P2343JAT is a low-power, 3-port DS3/E3/STS1 Line Interface Unit (LIU) with integrated Jitter Attenuator (JAT). It includes all the required clock recovery and transmitter pulse shaping functions for applications using 75-ohm coaxial cable at distances up to 1350 feet. These applications include DSLAMs, T1,3/E1,3 digital multiplexers, SONET Add/Drop multiplexers, PDH equipment, DS3 to Fiber optic and microwave modems and ATM WAN access for routers and switches.

The receiver recovers clock and data from a B3ZS or HDB3 coded AMI signal. It can compensate for over 12dB of cable and 6dB of flat loss. The transmitter generates a signal that meets the standard pulse shape requirements. The 78P2343JAT includes optional B3ZS/HDB3 ENDEC with a receive line code violation detector, loop-back modes, Loss of Signal detector, clock polarity selection, and the ability to receive a DSX3 monitor signal.

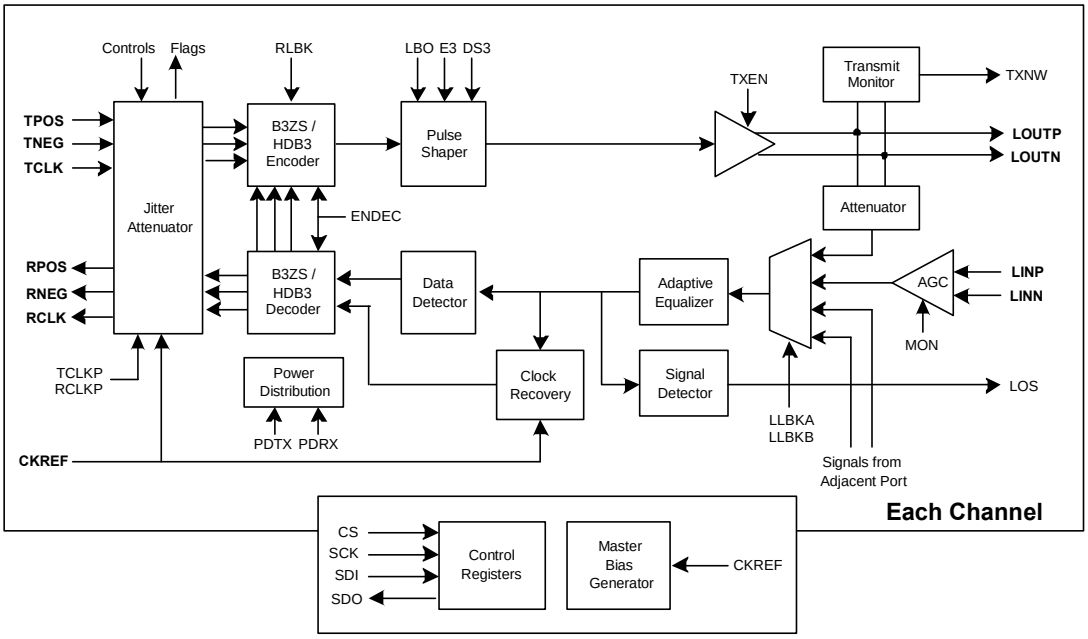
STANDARDS

- Telcordia GR-499-CORE and GR-253-CORE
- ITU-T G.823, G.824, G.775, and G.703
- ETSI TBR-24, ETS 300 686, ETS 300 687, and ETS EN 300 689
- ANSI T1.102-1993, T1.231-1997, T1.404-1994, and T1.105.03b

FEATURES

- Transmit and receive interfaces for E3, DS3 and STS-1 applications
- Designed for use with 75 ohm coaxial cable lengths up to 1350 ft
- Receives DS3-high and DSX3 monitor signals
- Local and Remote loopbacks
- Selectable B3ZS/HDB3 ENDEC with line code violation detector
- Standards-based LOS detector
- Optional serial-port based mode selection and channel status monitoring
- Adaptive digital clock recovery (uses line-rate reference clock input)
- Receive output clock maintains nominal line-rate frequency at all times
- Fully integrated Jitter Attenuation function provided for all line rates (no external VCXO required)
- Jitter Attenuator configurable for transmit or receive path
- Transmit line fault monitor
- Requires no external current-setting resistor or loop filter components
- Single 3.3V supply operation
- Standard and exposed pad 100-pin JEDEC LQFP package options available

BLOCK DIAGRAM



FUNCTIONAL DESCRIPTION

The 78P2343JAT contains all the necessary transmit and receive circuitry for connection between E3, DS3, or STS-1 line interfaces and digital Framer/Mapper ICs.

OPERATING RATE

The Master Control Register (MSCR) determines which mode the device operates in according to the table below. The MSL0 pin is also provided for mode selection in applications without a serial control interface. Upon power-up or reset, the state of the MSL0 pin is sensed and mapped into the DS3 and E3 register bits representing the appropriate mode of operation. After power-up/reset, the state of the MSL0 pin is ignored.

Standard	MSL0 pin	DS3 bit	E3 bit
E3	L	0	1
DS3	H	1	0
STS-1	Z	0	0
STS-1	Z	1	1

RECEIVER OPERATION

The receiver input is either transformer-coupled or capacitor-coupled to the line signal. In applications where the highest performance and isolation are required, a 1:1 transformer is used in the receive path. In applications where isolation is provided elsewhere in the circuit, capacitor coupling can be used. The receiver input should be line terminated externally with a termination resistor.

The AMI signal first enters an AGC, which has a selectable gain range setting. In normal operation, the AGC can compensate for signals with up to 6dB of flat loss. When Receiver Monitor Mode is enabled, the AGC can compensate for a DSX3 monitor signal with 16 to 20 dB of flat loss. The signal then enters a high performance adaptive equalizer. The equalizer is designed to overcome inter-symbol interference caused by long cable lengths. Because the equalizer is adaptive, the circuit will work with all square-shaped signals such as DS3-high or 34.368 Mbit/s E3. The variable gain differential amplifier automatically controls the gain to maintain a constant voltage level output regardless of the input voltage level.

The jitter tolerance of 78P2343JAT meets the requirements of ITU-T G.823 for E3 rates; the requirements of ITU-T G.824 and Telcordia GR-499 (Cat I and II) for DS3 rates; and the requirements of Telcordia GR-253 for STS1 rates.

With the Jitter Attenuator disabled, the jitter transfer function meets the requirements of GR-499 for Category II DS3 interfaces.

When the Jitter Attenuator is enabled, the 78P2343JAT meets the requirements of GR-499 and GR-253 for all categories of DS3/STS1 equipment and the ETSI TBR-24 requirements for E3 rates. To check conformance with other standards, please refer to the JITTER ATTENUATOR TRANSFER FUNCTION section for more detailed info.

RECEIVER MONITOR MODE

When in monitor mode, 20dB of flat gain is applied to the incoming signal before it is fed to the receive equalizer. This mode is controlled by the MON bit in the Mode Control Register.

SIGNAL DETECT

When the received signal is below a minimum threshold, the corresponding LOS signal (bit) is asserted. A time delay is provided before this output is active so that transient interruptions do not cause false indications. The LOS signal can also be used to trigger an interrupt on the INTRx pin when serial interface control is not available. This is controlled by setting the RXER bit in the Interrupt Control Register (INTC).

Note: In DS3 or STS-1 mode, when LBO is not enabled, the transmitters have to be properly terminated to ensure reliable LOS detection. If a transmitter is not terminated, the resultant 2x signal is large enough to couple to the neighboring receivers through the ESD diodes, causing false Signal Detect indication.

LOCAL LOOPBACK AND REDUNDANCY MUX

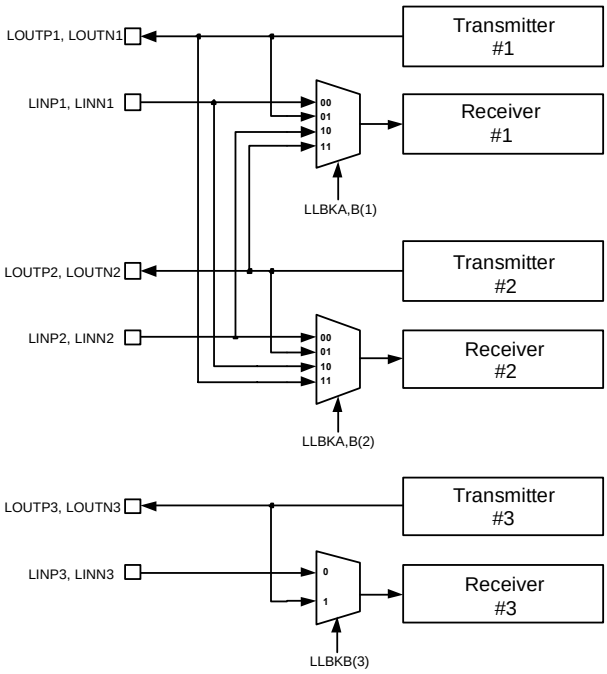
Receivers 1 and 2 have a 4-input MUX as shown in the adjacent figure. In multiport applications where redundant channels are required, the receiver MUX can be configured to provide the necessary multiplexing functions. This allows the user to use one port as a redundant monitor for the other port. The tables below show the register settings for selecting the desired receiver input source.

LLBKA (Port 1)	**LLBKB** (Port 1)	**Receiver #1 Input Source**
0	0	LINP1/LINN1
0	1	LOUTP1/LOUTN1
1	0	LINP2/LINN2
1	1	LOUTP2/LOUTN2

LLBKA (Port 2)	**LLBKB** (Port 2)	**Receiver #2 Input Source**
0	0	LINP2/LINN2
0	1	LOUTP2/LOUTN2
1	0	LINP1/LINN1
1	1	LOUTP1/LOUTN1

LLBKB (Port 3)	**Receiver #3 Input Source**
0	LINP3/LINN3
1	LOUTP3/LOUTN3

Note: The LLBKA and LLBKB bits are located in the Mode Control Register (MDCR). The Register Control bit, REGEN, should be enabled when using the register settings to avoid conflict with external loopback setting pins.



When serial interface control is not available, the respective LPBKx pin for each of the channels can also be used to activate local loopback mode as shown below. Note that redundant channel modes can only be activated using the serial interface.

LPBKx pin	**Loopback Mode**
L	Normal Operation Same as LLBKA,B = '00'
Z	Remote (Digital) Loopback Same as RLBK = '1'
H	Local (Analog) Loopback Same as LLBKA,B = '01'

B3ZS/HDB3 ENDEC WITH LINE CODE VIOLATION DETECT

The 78P2343JAT includes a selectable B3ZS/HDB3 Encoder/Decoder (ENDEC). The ENDEC function can be enabled or disabled through pin selection or register setting as shown below.

ENDECB bit/pin	RPOSx	RNEGx
0 / L	NRZ data	Receive Line Code Violation Indicator
1 / H	Positive AMI	Negative AMI

When the ENDEC is enabled, the decoder generates a composite NRZ logic data stream following the B3ZS (for DS3/STS-1) or HDB3 (for E3) substitution codes via the RPOSx pins:

The decoder also detects Receive Line Code Violations (RLCV) and outputs a pulse via the RNEG pin. Three different classes of line code violations are detected.

1) Too many zeros: More than two (three) consecutive zeros in B3ZS (HDB3) mode.
2) Not enough zeros between bipolar pulse (B) and bipolar violation pulse (V): (B,V) for B3ZS. (B,V) or (B,0,V) for HDB3.
3) Code violation: Even number of bipolar pulses (B) detected between bipolar violation pulses (V).

When the ENDEC is disabled, the 78P2343JAT outputs a dual rail data stream via the RPOSx and RNEGx pins. In this mode, the Framer/Mapper providing the ENDEC function typically detects Line Code Violations.

On the transmit side, when the ENDEC is enabled, NRZ input data is encoded to Positive and Negative AMI logic data following the B3ZS (for DS3/STS-1) or HDB3 (for E3) substitution codes. The NRZ data is input to the TPOS pin as shown below:

ENDECB bit/pin	TPOSx	TNEGx
0 / L	NRZ data	'Don't Care'
1 / H	Positive AMI	Negative AMI

TRANSMITTER OPERATION

Transmitters 1-3 are enabled by their corresponding TXEN bit. When enabled, each transmitter accepts logic level clock and data signals and generates current pulses on the LOUTPx and LOUTNx pins. When properly connected to a 1:2CT center-tapped transformer, a standards compliant AMI pulse is generated which can drive a 75Ω coaxial cable.

When the recommended transformer is used and when DS3 mode is selected, the transmitted pulse shape at the end of the 75Ω terminated cable of 0 to 450 feet will fit the DS3 template in ANSI T1.102-1993 and Telcordia GR-499-CORE. For STS-1 applications, the transmitted pulse for a short cable meets the requirements of Telcordia GR-253-CORE. For E3 applications, the transmitted pulse for a short cable meets the requirements of ITU-T G.703.

In either DS3 and STS-1 modes, the LBOx pin or LBO bit should be set high for short cable (< 225 ft), and should be set low for long cable (> 225 ft). The LBO settings are ignored in E3 mode.

RCLK/TCLK POLARITY REVERSAL

To simplify the interface with various framer circuitry, TCLK polarity can be internally inverted by setting the TCLKP bit, and RCLK polarity can be inverted by setting the RCLKP bit. Both bits are located in the Master Control Register (MSCR).

REMOTE (DIGITAL) LOOPBACK

When the Register Control bit, REGEN, is disabled and the LPBKx pin is floating; or when the Register Control bit, REGEN, is enabled and the RLBK bit is set, RCLKx, RNEGx, and RPOSx outputs are internally looped back to the TCLKx, TNEGx, and TPOSx inputs respectively.

LINE BUILD-OUT

The Line Build-Out (LBO) function controls the transmit amplitude and pulse shape in DS3 and STS-1 modes. The selection of LBO depends on the amount of cable the transmitter is connected to. When less than 225 ft of cable is used, the corresponding LBOx pin or LBO bit should be high. When 225ft or more cable is used the corresponding LBO setting (LBOx pin or LBO bit) should be low. LBO can be controlled either from pins or from register settings, depending on the status of the Register Control bit, REGEN.

TRANSMIT ENABLE

The TXEN bit in the Mode Control Register controls the transmitter output. When logic zero, the transmitter output is disabled. This feature is used to disable ports as well as to multiplex two or more transceivers to one port. The transmitter of any port can also be disabled by floating the respective LBOx pin, in which case it will also power-down the entire transmitter. See section on the Power-Down Function for more info.

TRANSMIT MONITOR

The transmit monitor function detects activity on the transmitter output at the LOUTPx and LOUTNx pins. When there is a transmitter fault, in the case of an open or short on the chip, the transformer, or the circuit board, the transmit signal amplitude will be altered. The transmit monitor detects the amplitude of the driven signal. The TXNW signal (bit) goes high when the amplitude of the transmit signal is outside a valid amplitude range. When the signal amplitude is either too high or too low for longer than a specified duration, the TXNW bit goes high (See Transmit Monitor Specifications, pg.28). The TXNW signal can be also used to trigger an interrupt on the INTRx pin when serial interface control is not available.

JITTER ATTENUATOR

Jitter Attenuation function is provided on-chip. The Jitter Attenuator can be configured to be in the transmit or the receive path. When configured in the transmit path, the input clock at TCLK pin is passed through a very low bandwidth digital PLL. The corresponding transmit data is buffered into a FIFO and clocked out using the de-jittered output clock of the PLL. When configured in the receive path, the recovered clock is passed through the low bandwidth digital PLL, and the corresponding receive data is buffered into the FIFO and clocked out using the de-jittered clock.

The Jitter Attenuator can be configured independently for each channel by writing to the Jitter Attenuator Control Register (JACR) as follows:

JAEN bit	JASL bit	Jitter Attenuator Mode
0	X	Jitter Attenuator disabled
1	0	Jitter Attenuator configured to be in the receive path
1	1	Jitter Attenuator configured to be in the transmit path

When serial interface control is not available, the MSL1 pin is provided for global Jitter Attenuator mode selection. Upon power-up or reset, the state of the MSL1 pin is sensed and mapped into the JAEN and JASL register bits for all channels, representing the appropriate mode of operation. After power-up or reset, the state of the MSL1 pin is ignored. The state of the MSL1 pin, and the corresponding Jitter Attenuator configuration is shown below.

MSL1 pin	Jitter Attenuator Mode
L	Jitter Attenuator in receive path
H	Jitter Attenuator in transmit path
Z	Jitter Attenuator disabled

PLL Bandwidth

A PLL response with effectively one pole below 27 Hz is adequate to meet the ETSI TBR24 E3 standards. A PLL response with one pole below 40 Hz is adequate to meet the GR-499 (Cat I) DS3 standards. One of two bandwidths can be selected via register settings. The PLL bandwidth is proportional to the data rate as follows:

Line Rate	JABW bit	PLL Bandwidth (Hz)
E3	0	*13
	1	188
DS3	0	*17
	1	245
STS1	0	20
	1	*283

*The default state of the JABW bit depends on which line-rate is selected through the MSL0 pin. If E3 or DS3 mode is selected, the default state is ‘0’. If STS1 mode is selected, the default state is ‘1’.

Elastic Store Depth

To optimize the trade-off between data latency and clock wander tolerance, the FIFO elastic store depth can be selected through the serial port by writing to the Jitter Attenuator Control Register (JACR) as follows:

ESP[1:0] bits	Elastic Store Depth
00	Pass-Through mode
01	16 UI
10	32 UI
11	64 UI (default)

The Elastic Store Depth selects the nominal FIFO read pointer address. The total or maximum elastic store depth is set to be twice as deep as the nominal pointer address. The circular buffer length is always twice as long as the nominal pointer address.

POWER-DOWN FUNCTION

Power-down control is provided to allow the transceivers to be shut off individually. Transmit and receive power-down can be set independently via the PDTX and PDRX bits in the Mode Control Register. Floating the respective LBOx pin can also set PDTX for each channel. The Serial Control Interface and Configuration Registers are not affected by power-down.

INTERNAL POWER-ON RESET

The 78P2343JAT includes on-chip Power-On Reset (POR) function to ensure the serial-port registers are initialized to known default states upon power-up. Roughly 50us after Vcc reaches 2.4V at power up, reset is released. This reset signal also sets all state machines within the LIU to nominal operational states. The internal reset signal is also brought out to the PORB pin. This pin is a multi-function pin that allows for the following:

1) Override the internal POR signal by driving in an external active-low reset signal;
2) Monitor the state of the internal POR signal (for test and debug only);
3) Add external capacitor to delay the release of the internal power-on reset signal to allow the MSL0 pin to stabilize prior to release of reset (approximately 8μs per nF added).

The internal resistance of the PORB pin is approximately 5kΩ.

SERIAL CONTROL INTERFACE

The serial port controlled register allows a generic controller to interface with the 78P2343JAT. It is used for mode settings, diagnostics and test, and the retrieval of status and performance information.

The serial interface consists of four pins: Chip Select (CS), Serial Clock (SCK), Serial Data In (SDI), and Serial Data Out (SDO). The CS pin initiates the read and write operations. It can also be used to select a particular device allowing SCK, SDI and SDO to be bussed together. SCK is the clock input that times the data on SDI and SDO. Data on SDI is latched in on the rising-edge of SCK, and data on SDO is clocked out using the falling edge of SCK.

SDI is used to insert mode, address, and register data into the chip. Address and Data information are input least significant bit (LSB) first.

SDO is a tristate capable output. It is used to output register data during a read operation. SDO output is normally high impedance, and is enabled only during the duration when register data is being clocked out. Read data is clocked out least significant bit (LSB) first.

If SDI coming out of the micro-controller chip is also tristate capable, SDI and SDO can be connected together to simplify connections.

The maximum clock frequency for register access is 20MHz.

Note: To allow equipment to power up in a known state, some register defaults are set by their corresponding pin control at power-up.

GLOBAL REGISTERS

ADDRESS 0-0: MASTER CONTROL REGISTER

BIT	NAME	TYPE	DFLT VALUE	DESCRIPTION
7	REGEN	R/W	0	**Register Control Enable**: 0 : Pin selection overrides register settings 1 : Device is controlled via register set. **NOTE: Pin 15 (ENDECB) must be tied low when REGEN is enabled.**
6	DS3	R/W	X	**Line Speed Selection**: Selects the line speed of all channels as well as the input clock frequency at the CKREF pin. [DS3 E3] = 00 : STS-1 (51.840MHz) 01 : E3 (34.368MHz) 10 : DS3 (44.736MHz) 11 : STS-1 (51.840MHz) NOTE: The default values of these register bits depend on the state of the MSL0 pin upon power-up or reset.
5	E3	R/W	X	
4	ENDECB	R/W	0	**Encoder/Decoder Disable**: 0 : selects NRZ digital data interface 1 : selects AMI digital data interface NOTE: Relevant only when the REGEN bit is set. Otherwise, ENDECB pin selection prevails.
3	RCLKP	R/W	0	**RCLK Polarity Selection**: 0 : Receive Data clocked out on the falling-edge of RCLK 1 : Receive Data clocked out on the rising-edge of RCLK
2	TCLKP	R/W	0	**TCLK Polarity Selection**: 0 : Transmit Data clocked in on the rising-edge of TCLK 1 : Transmit Data clocked in on the falling-edge of TCLK
1	RSVD	R/O	--	Reserved
0	SRST	R/W	0	**Register Soft-Reset**: When this bit is set, all registers are reset to their default values. Also resets Jitter Attenuator to “centered” states. This register bit is self-clearing.

REGISTER DESCRIPTION (continued)

ADDRESS 0-1: INTERRUPT CONTROL REGISTER

This register selects the events that would cause the respective interrupt pin (INTRx) for each of the ports to be activated. User may set as many bits as required.

BIT	NAME	TYPE	DFLT VALUE	DESCRIPTION
7	INPOL	R/W	0	**Interrupt Pin Polarity Selection**: 0 : Interrupt output is active-low 1 : Interrupt output is active-high
6:3	RSVD	R/O	--	Reserved
2	JAER	R/W	0	**Jitter Attenuator Error Event**: When set, JAT FIFO overflow or underflow (as indicated by the FERR bit) will cause an interrupt to be flagged.
1	RXER	R/W	1	**Receiver Error Event**: When set, loss of receive signal (as indicated by the LOS bit) will cause an interrupt to be flagged.
0	TXER	R/W	1	**Transmitter Error Event**: When set, transmitter fault (as indicated by the TXNW bit) will cause an interrupt to be flagged.

REGISTER DESCRIPTION (continued)

PORT-SPECIFIC REGISTERS

For PA[3:0] = N = 1-3 only. Accessing a register with port address greater than 3 constitutes an invalid command, and the read/write operation will be ignored.

ADDRESS N-0: MODE CONTROL REGISTER

BIT	NAME	TYPE	DFLT VALUE	DESCRIPTION
7	PDTX	R/W	0	**Transmitter Power-Down**: 0 : Normal Operation 1 : Power-Down NOTE: Relevant only when the REGEN bit is set. Otherwise, LBOx pin selection prevails.
6	PDRX	R/W	0	**Receiver Power-Down**: 0 : Normal Operation 1 : Power-Down
5	LBO	R/W	1	**Transmitter Line Build-Out** (DS3 and STS-1 only): 0 : ≥ 225ft of cable attached to the cross-connect 1 : < 225ft of cable attached to the cross-connect NOTE: Relevant only when the REGEN bit is set. Otherwise, LBOx pin selection prevails.
4	LLBKA	R/W	0	**Local (Analog) Loopback Mode Selection**: [LLBKA : LLBKB] = 00 : Normal operation 01 : Local (Analog) Loopback 10 : Adjacent receiver input (see page 3) 11 : Adjacent transmitter loopback (see page 3) NOTE: Relevant only when the REGEN bit is set. Otherwise, LPBKx pin selection prevails.
3	LLBKB	R/W	0	
2	RLBK	R/W	0	**Remote (Digital) Loopback Enable**: 0 : Normal Operation 1 : Loops RCLK, RPOS, and RNEG back onto TCLK, TPOS, and TNEG NOTE: Relevant only when the REGEN bit is set. Otherwise, LPBKx pin selection prevails.
1	MON	R/W	0	**Monitor Mode Enable**: Used for reception of split-off signals that are flat attenuated by at least 16dB but no more than 20dB. 0 : Disable 1 : Enable
0	TXEN	R/W	1	**Transmitter Output Enable**: 0 : Transmit driver is disabled. Output is tri-stated. 1 : Normal Operation NOTE: Relevant only when the REGEN bit is set. Otherwise, LBOx pin selection prevails.

REGISTER DESCRIPTION (continued)

ADDRESS N-1: STATUS MONITOR REGISTER

BIT	NAME	TYPE	DFLT VALUE	DESCRIPTION
7	FERR	R/O	X	**Jitter Attenuator FIFO Error Flag**: This bit is set whenever a FIFO overflow or underflow occurred. It is reset after a read operation to this register. 0 : Proper Operation 1 : FIFO Overflow/Underflow
6:4	RSVD	R/O	X	Reserved
3	LOS	R/O	X	**Loss-of-Signal Indication**: 0 : Signal Detector detecting a valid receive input signal 1 : Standards-based Loss-of-Signal indication NOTE: RPOSx and RNEGx are forced low when LOS='1'. RCLK will continue to output a line rate clock
2	TXNW	R/O	X	**Transmitter Not-Working Indication**: 0 : Transmitter OK 1 : Transmitter not working
1	RSVD	R/O	X	Reserved
0	SGLO	R/O	X	**Signal Low Indication**: 0 : Receive signal level OK 1 : Receive signal level too low / Loss of signal

REGISTER DESCRIPTION (continued)

ADDRESS N-3: JITTER ATTENUATOR CONTROL REGISTER

BIT	NAME	TYPE	DFLT VALUE	DESCRIPTION
7	JAEN	R/W	X	**Jitter Attenuator Enable**: 0 : Disables jitter attenuation function 1 : Enables jitter attenuation function NOTE: The default values of these register bits depend on the state of the MSL1 pin upon power-up or reset.
6	JASL	R/W	X	**Jitter Attenuation Selection**: 0 : Jitter Attenuator on the receive path 1 : Jitter Attenuator on the transmit path NOTE: The default values of these register bits depend on the state of the MSL1 pin upon power-up or reset.
5	JLBK	R/W	0	**Jitter Attenuator Local Loopback Enable**: 0 : Normal Operation 1 : TCLKx, TPOSx, TNEGx connected to JAT input and RCLKx, RPOSx, RNEGx connected to JAT output NOTE: If both RLBK and JLBK bits are set, RLBK mode takes priority.
4	RSVD	R/W	0	**Reserved. Must be set to zero**.
3:2	ESP [1:0]	R/W	11	**FIFO Elastic Store Pointer Selection**: ESP[1:0] = 00 : Pass-through 01 : 8 UI 10 : 16 UI 11 : 32 UI (default)
1	RSVD	R/W	0	**Reserved. Must be set to zero**.
0	JABW	R/W	X	**Jitter Attenuator Bandwidth Selection**: 0 : Low bandwidth 1 : High bandwidth (see JAT Bandwidth Selection Table on page 5) NOTE: The default values of these register bits depend on the state of the MSL0 pin upon power-up or reset. If the state of the MSL0 pin selects E3 or DS3 mode, the default value of JABW is '0'. If the state of the MSL0 pin selects STS1 mode, the default value of JABW is '1'.

TRANSMITTER PINS

NAME	PIN	TYPE	DESCRIPTION
TPOSx	23, 31 39	CI	**Transmit Positive Data/Transmit NRZ**: When ENDECB ='1', a logic one on this pin generates a positive AMI pulse on the coax. This pin should not be high at the same time that corresponding TNEGx is high. When ENDECB ='0', data on this pin is encoded and converted into positive and negative AMI pulses.
TNEGx	24, 32 40	CI	**Transmit Negative Data**: When ENDECB ='1', a logic one on this pin generates a negative AMI pulse on the coax. This pin should not be high at the same time that corresponding TPOSx is high. When ENDECB ='0', this pin is ignored.
TCLKx	25, 33 41	CIS	**Transmitter Clock Input**: This signal is used to latch the respective TPOSx and TNEGx signals into the 78P2343JAT.
LOUTPx LOUTNx	98, 92 85 99, 93 86	A	**Line Out**: Differential AMI Outputs. Requires a 1:2CT center-tapped transformer and a shunt termination resistor. See APPLICATION INFORMATION section for more info.

PIN DESCRIPTION (continued)

RECEIVER PINS

NAME	PIN	TYPE	DESCRIPTION
CKREF	57	CIS	**Reference Clock Input**: This clock should be from a clean source (± 20 ppm) and match the selected line-rate frequency as follows: E3 : 34.368 MHz DS3: 44.736 MHz STS-1: 51.840 MHz
RCLKx	27, 35 43	CO	**Receive Clock**: Recovered receive clock output. NOTE: During LOS conditions, RCLKx will continue to output a line rate clock
RNEGx	28, 36 44	CO	**Receive Negative Data**: When ENDECB ='1', this pin indicates reception of a negative AMI pulse on the coax. When ENDECB ='0', this pin outputs a one when a Receive Line Code Violation (RLCV) is detected. NOTE: During LOS conditions, RNEGx output is squelched
RPOSx	29, 37 45	CO	**Receive Positive Data/NRZ Data**: When ENDECB ='1', this pin indicates reception of a positive AMI pulse on the coax cable. When ENDECB ='0', it outputs decoded NRZ data. NOTE: During LOS conditions, RPOSx output is squelched
LINPx LINNx	96, 90 83 95, 89 82	A	**Line In**: Differential AMI Inputs. Should be 1:1 transformer-coupled and terminated with a shunt resistor. See APPLICATION INFORMATION section for more info.

PIN DESCRIPTION (continued)

CONTROL AND STATUS PINS

NAME	PIN	TYPE	DESCRIPTION
MSL0	19	CIT	**Data-Rate Mode Selection**: Low = E3 mode High = DS3 mode Float = STS-1 mode NOTE: Pin state is latched-in on rising-edge of PORB signal. Pin state is ignored after reset.
MSL1	20	CIT	**Jitter Attenuator Mode Selection**: Low = JAT in Receive path High = JAT in Transmit path Float = JAT is bypassed NOTE: Pin state is latched-in on rising-edge of PORB signal. Pin state is ignored after reset.
PORB	14	A	**Chip Reset** (active-low): Forces hardware reset on device. See description on *Internal Power-on Reset* for complete use of this pin.
ENDECB	15	CID	**ENDEC Enable** (active-low): Set high to disable internal ENDEC function. See description on *B3ZS/HDB3 ENDEC with Line Code Violation Detect* for complete use of this pin. NOTE: Relevant only when the REGEN bit is '0'. ***Pin must be held low when the REGEN bit is set.***
LBOx	5, 6 7	CIT	**Line Build-Out**: Low = Used with 225ft or more of cable. High = Used with less than 225ft of cable. Float = Disable and power down transmitter. [TXEN=0; PDTX=1] NOTE: LBO control relevant only when the REGEN bit is '0'. Pin state sampled approximately once every 0.5ms.
LPBKx	10, 11 12	CIT	**Loopback Enable**: Low = Normal Operation High = Local Loopback. Transmitter looped back to Receiver Float = Remote Loopback. Receiver looped back to Transmitter NOTE: Relevant only when the REGEN bit is '0'. Pin state sampled approximately once every 0.5ms.
INTRx	64, 63 62	CO	**Interrupt Flag**: This pin is normally high when the INPOL bit is '0' (default), and normally low when the INPOL bit is '1'. When an interrupt event occurs (as defined in the Interrupt Control Register description), the respective INTRx pin will change state.

PIN DESCRIPTION (continued)

SERIAL-PORT PINS

NAME	PIN	TYPE	DESCRIPTION
CS	65	CI	**Chip Select**: High during write and read operations. Low disables the serial port. While CS is low, SDO remains in high impedance state, and SDI and SCK activities are ignored.
SCK	66	CIS	**Serial Clock**: Controls the timing of SDI and SDO.
SDI	68	CI	**Serial Data Input**: Inputs mode and address information. Also inputs register data during a Write operation. Both address and data are input least significant bit first.
SDO	67	COZ	**Serial Data Output**: Outputs register information during a Read operation. Data is output least significant bit first.

POWER AND GROUND PINS

It is recommended that all supply pins be connected to a single power supply plane and all ground pins be connected to a single ground plane.

NAME	PINS	TYPE	DESCRIPTION
VCC	1, 2, 3, 4, 17, 59, 72, 73, 74, 75	S	**Analog Power Supply**
GND	18, 60, 78, 81, 84, 87, 91, 94, 97, 100	S	**Analog Ground**
VCCD	16, 22, 30, 38, 46, 54, 55, 58	S	**Digital Power Supply**
GNDD	9, 21, 26, 34, 42, 50, 56, 69	S	**Digital Ground**

ELECTRICAL SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

Operation beyond these limits may permanently damage the device.

PARAMETER	RATING
Supply Voltage (VCC/VCCD)	-0.5 to 4.0 VDC
Storage Temperature	-65 to 150 °C
Junction Temperature	-40 to 125 °C
Pin Voltage (LOUTPx, LOUTNx)	VCC + 1.5 VDC
Pin Voltage (all other pins)	-0.3 to (VCC+0.6) VDC
Pin Current	±100 mA

RECOMMENDED OPERATING CONDITIONS

Unless otherwise noted all specifications are valid over these temperatures and supply voltage ranges.

PARAMETER	RATING
DC Voltage Supply (VCC/VCCD)	3.0 to 3.6 V
Ambient Operating Temperature	-40 to 85°C

DC CHARACTERISTICS:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Supply Current All channels enabled; LBO=0	Idd	DS3/E3 mode JAT Enabled: JAT Disabled:		 265 246	 288 267	mA
Receive-only Supply Current All channels PDTX = 1	Iddr	DS3/E3 mode JAT Enabled: JAT Disabled:		 118 97	 128 105	mA
Transmit-only Supply Current All channels PDRX = 1; LBO=0	Iddt	DS3/E3 mode JAT Enabled: JAT Disabled:		 195 165		mA
Supply Current per Port (including transmitter current through transformer)	Iddx	DS3/E3 mode JAT Enabled: JAT Disabled:		 82 76		mA
Power-Down Current	Iddq	PDTX = 1, PDRX = 1		20	30	mA

ELECTRICAL SPECIFICATIONS (continued)

ANALOG PINS CHARACTERISTICS:
The following table is provided for informative purpose only. Not tested in production.

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
LINPx and LINNx Common-Mode Bias Voltage	Vblin	Ground reference	1.9	2.25	2.6	V
LINPx and LINNx Differential Input Impedance	Rilin			10		kΩ
PORB Input Impedance	Ripor			5		kΩ

DIGITAL I/O CHARACTERISTICS:

Pins of type CI, CIU, CID:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Input Voltage Low	Vil				0.8	V
Input Voltage High	Vih		2.0			V
Input Current	Iil, Iih		-1		1	µA
Pull-up Resistance	Rpu	Type CIU only	32	56	84	kΩ
Pull-down Resistance	Rpd	Type CID only	32	56	84	kΩ
Input Capacitance	Cin			8		pF

Pins of type CIS:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Low-to-High Threshold	Vt+		1.3		1.7	V
High-to-Low Threshold	Vt-		0.8		1.2	V
Input Current	Iil, Iih		-1		1	µA
Input Capacitance	Cin			8		pF

ELECTRICAL SPECIFICATIONS (continued)

Pins of type CIT:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Input Voltage Low	Vtil				0.8	V
Input Voltage High	Vtih		2.0			V
Minimum impedance to be considered as “float” state	Rtiz		30			kΩ

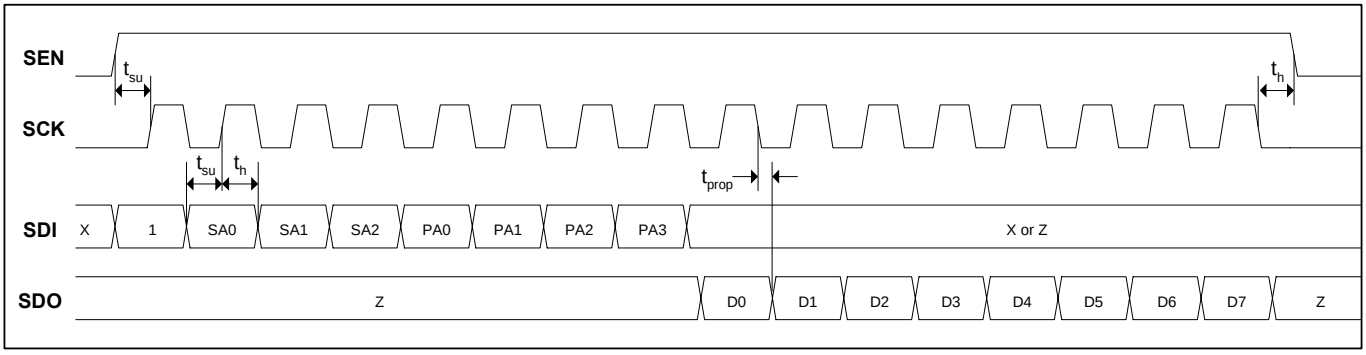
Pins of type CO and COZ:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Output Voltage Low	Vol	Iol = 8mA			0.4	V
Output Voltage High	Voh	Ioh = -8mA	2.4			V
Output Transition Time	Tt	C_L = 20pF; (20-80%)			6	ns
Pin Capacitance	Cout			8		pF
Effective Source Impedance	Rsrc			30		Ω
Tristate Output Leakage Current	Iz	Type COZ only	-1		1	µA

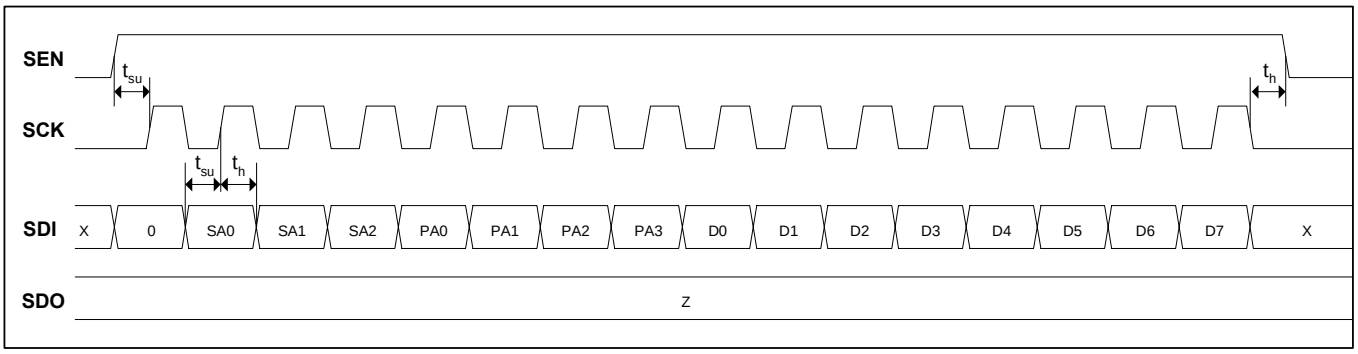
ELECTRICAL SPECIFICATIONS (continued)

SERIAL-PORT TIMING CHARACTERISTICS:

PARAMETER	SYMBOL	CONDITION	MIN	TYP	MAX	UNIT
CS or SDI to SCK setup time	t_{su}		4			ns
CS or SDI to SCK hold time	t_h		4			ns
SCK to SDO propagation delay	t_{prop}		5		12	ns
SCK Frequency	SCK				20	MHz



Read Operation



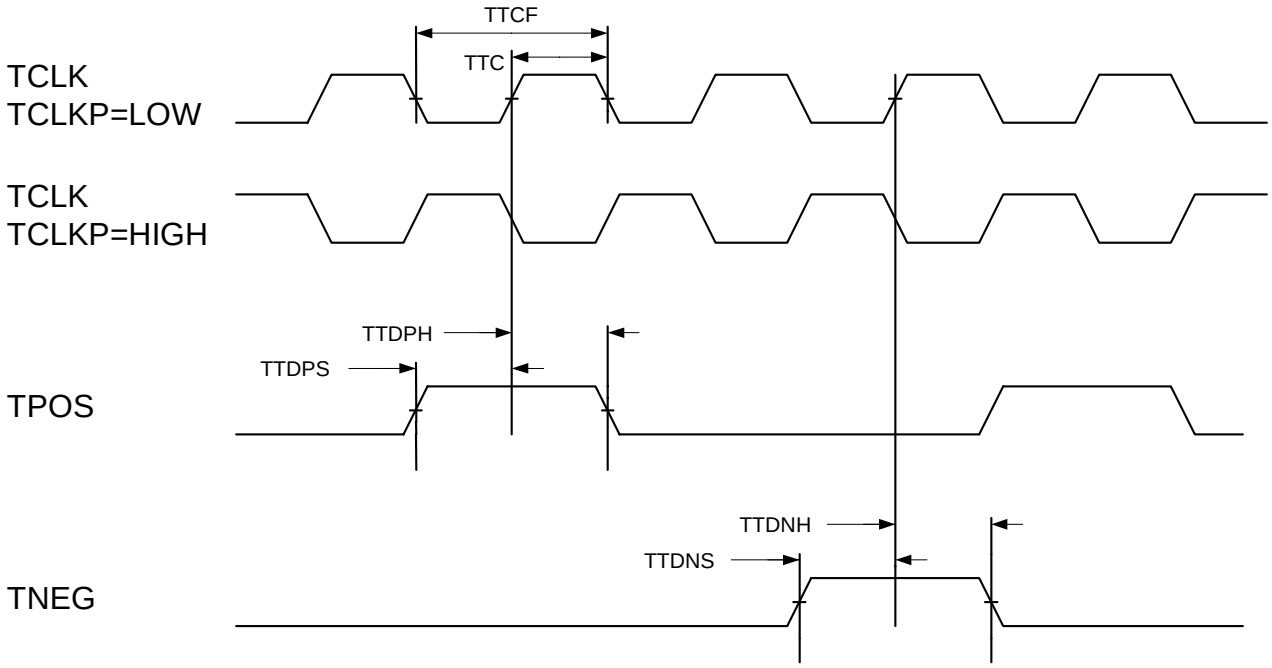
Write Operation

ELECTRICAL SPECIFICATIONS (continued)

TRANSMIT TIMING CHARACTERISTICS:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
Clock Duty Cycle	TTC/TTCF		40		60	%
Setup Time	TTDxS		2.5			ns
Hold Time	TTDxH		2.5			ns

TIMING DIAGRAM: Transmitter Waveforms (E3/DS3/STS-1)



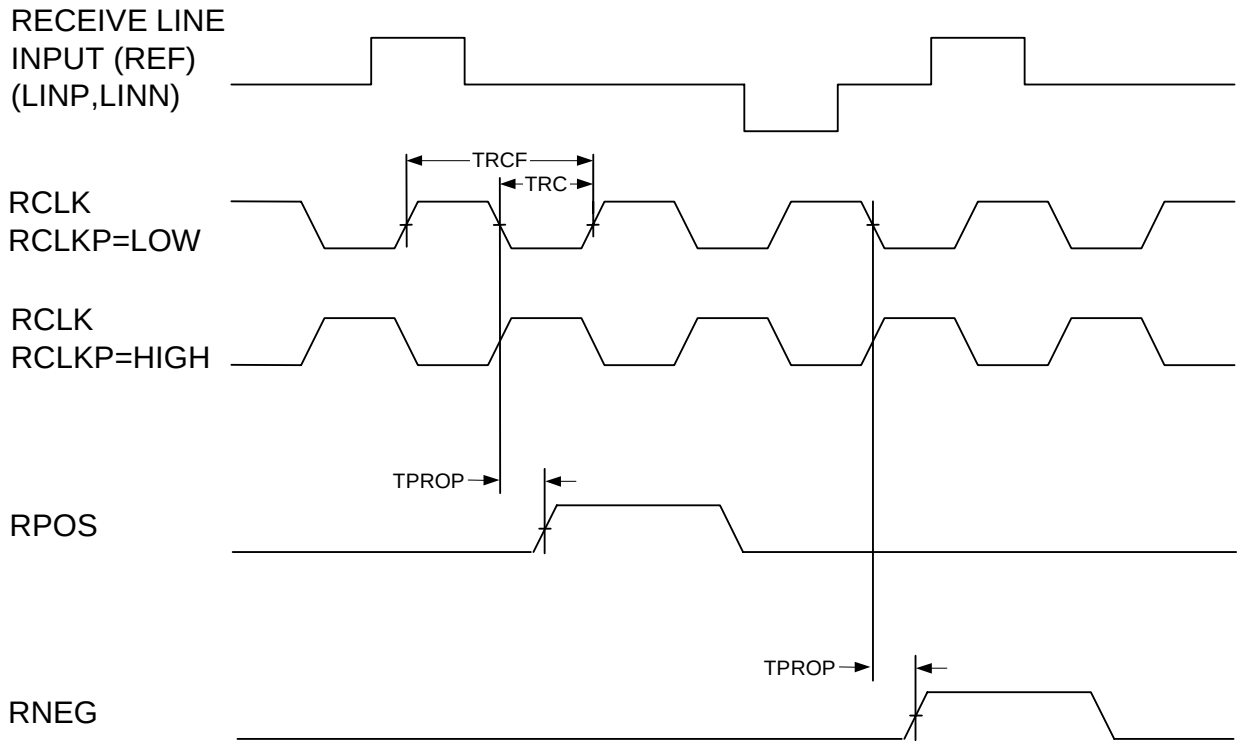
ELECTRICAL SPECIFICATIONS (continued)

RECEIVE TIMING CHARACTERISTICS:

PARAMETER	SYMBOL	CONDITIONS	MIN	NOM	MAX	UNIT
CKREF Duty Cycle	--		40		60	%
CKREF Frequency Stability	--	w.r.t. line-rate frequency	-20		+20	ppm
RCLK Duty Cycle	TRC/TRCF		40		60	%
Data Propagation Delay	TPROP		-0.3		3	ns
Receive Loss of Signal Assert Timing	--	E3 mode	10	140	255	UI
		DS3 mode	100	150	250	UI
		STS1 mode	2.3	3	100	µS
Receive Loss of Signal De-assert Timing	--	E3 mode	10	130	255	UI
		DS3 mode	100	130	250	UI
		STS1 mode, see Note 1	2.3	3	250	µS

Note 1: At least a 100µS of software delay must be added after STS-1 LOS de-assertion to be compliant with the ANSI T1.231 requirement of 100 to 250µS.

TIMING DIAGRAM: Receive Waveforms (E3/DS3/STS-1)



ELECTRICAL SPECIFICATIONS (continued)

E3 – TRANSMITTER SPECIFICATIONS

PARAMETER	CONDITION (see timing diagram)	MIN	TYP	MAX	UNIT
Transmitter Amplitude	Measured at 0ft of terminated 75ohm cable.	900	1000	1100	mVpk
Transmitter Amplitude Mismatch	Ratio of amplitudes of positive and negative pulses measured at pulse centers	0.95		1.05	
Transmitter Pulsewidth Mismatch	Ratio of widths of positive and negative pulses measured at pulse half amplitude	0.95		1.05	
Transmitter Pulsewidth	Measured at 0ft of terminated 75ohm cable.	12.1	14.8	17	ns

DS3 – TRANSMITTER SPECIFICATIONS

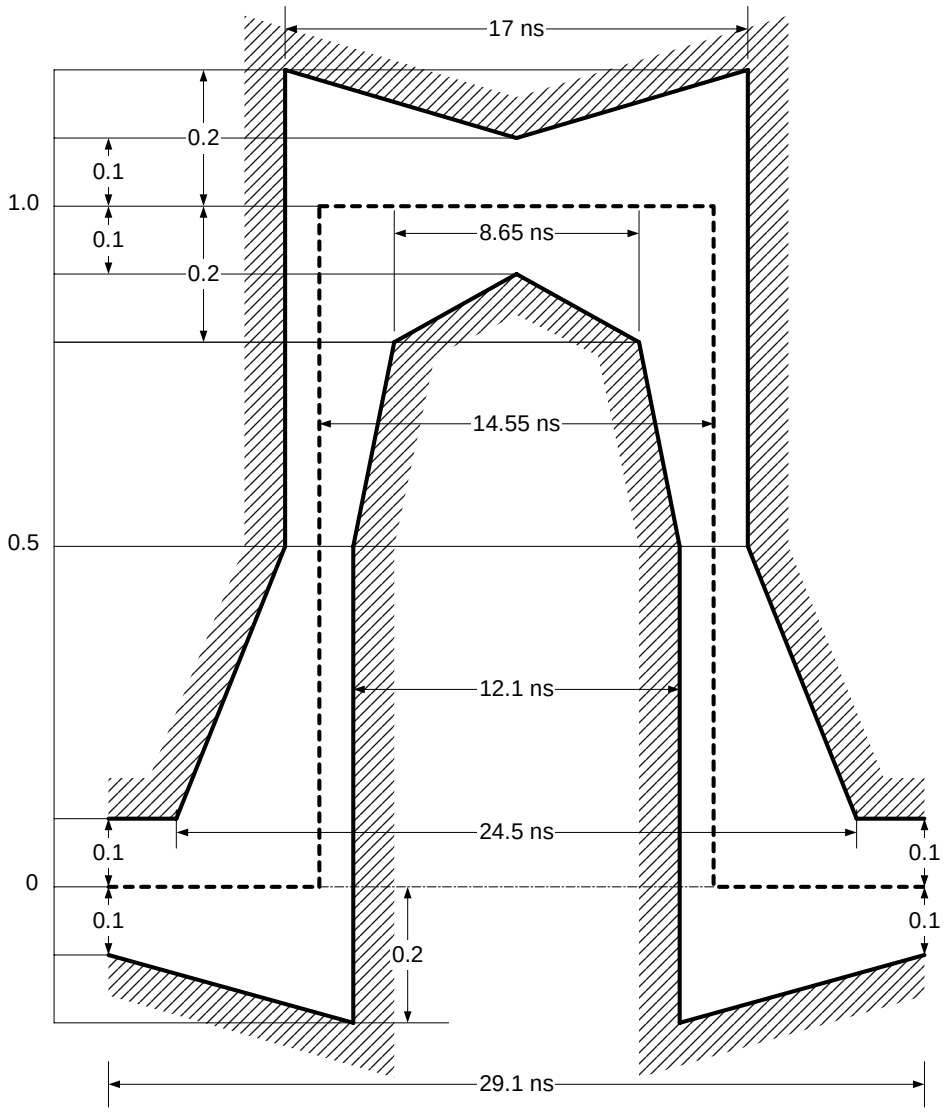
PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Transmitter Amplitude	Measured at 0ft of terminated 75ohm cable with LBO pin held high (enabled).	700	800	850	mVpk
Transmitter Amplitude Mismatch	Ratio of amplitudes of positive and negative pulses measured at pulse peaks.	0.9		1.1	
Transmitter Power at 22.368 MHz	All ones pattern, 3kHz bandwidth	-1.8		+5.7	dBm
Harmonic Power at 44.736 MHz	All ones pattern Power below fundamental at 22.368MHz			-20	dBm

STS-1 – TRANSMITTER SPECIFICATIONS

PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Transmitter Amplitude	Measured at 0ft of terminated 75ohm cable with LBO pin held high (enabled).	700	825	950	mVpk
Transmitter Amplitude Mismatch	Ratio of amplitudes of positive and negative pulses measured at pulse peaks.	0.9		1.1	
Transmitter Power	PRBS15 pattern band-limited to 207.36MHz.	-2.7		+4.7	dBm

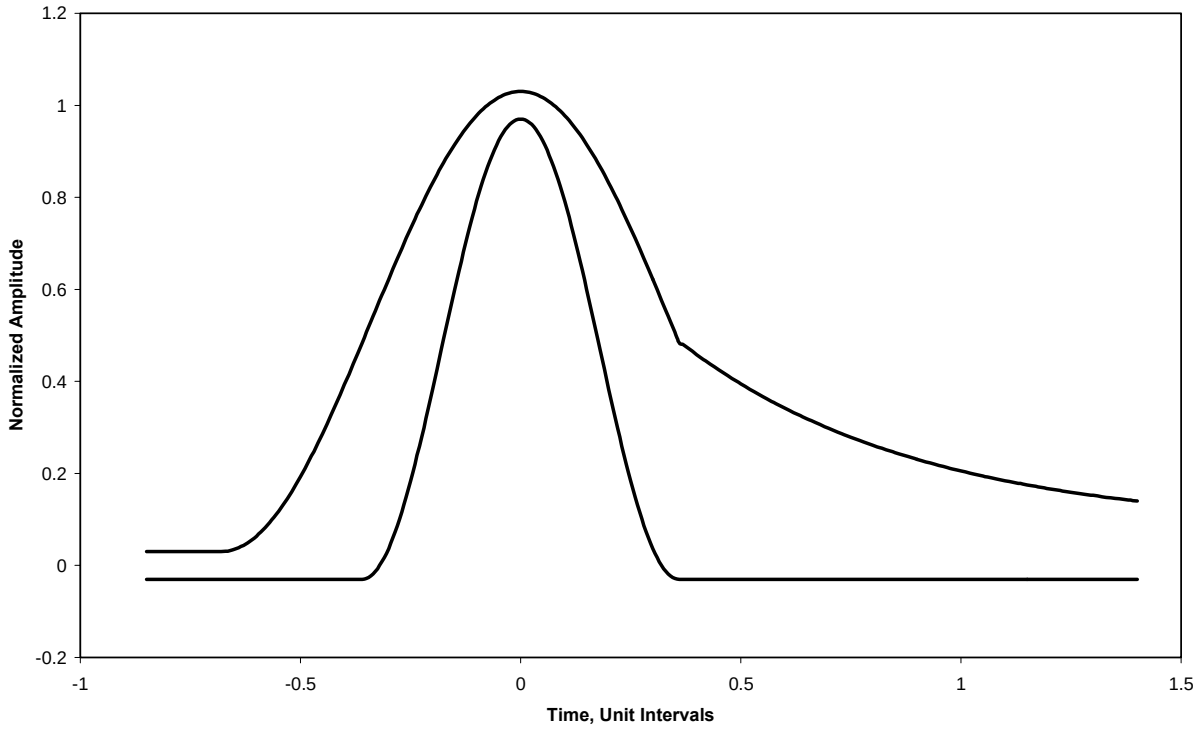
ELECTRICAL SPECIFICATIONS (continued)

E3 TRANSMIT PULSE TEMPLATE



ELECTRICAL SPECIFICATIONS (continued)

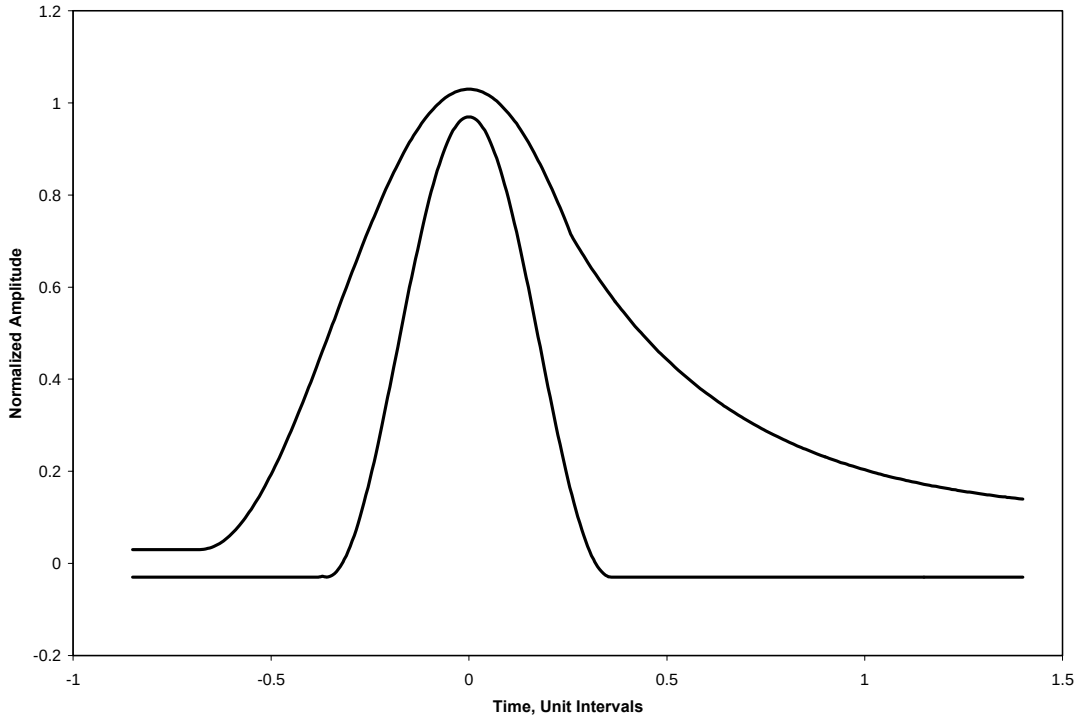
DS3 TRANSMIT PULSE TEMPLATE



Time axis range (UI)	Normalized amplitude equation
UPPER CURVE	
$-0.85 \leq T \leq -0.68$	0.03
$-0.68 \leq T \leq 0.36$	$0.03 + 0.5\{1+\sin[(\pi/2)(1+T/0.34)]\}$
$0.36 \leq T \leq 1.4$	$0.08+0.407\ e^{-1.84(T-0.36)}$
LOWER CURVE	
$-0.85 \leq T \leq -0.36$	-0.03
$-0.36 \leq T \leq 0.36$	$-0.03 + 0.5\{1+\sin[(\pi/2)(1 + T/0.18)]\}$
$0.36 \leq T \leq 1.4$	-0.03

ELECTRICAL SPECIFICATIONS (continued)

STS-1 TRANSMIT PULSE TEMPLATE



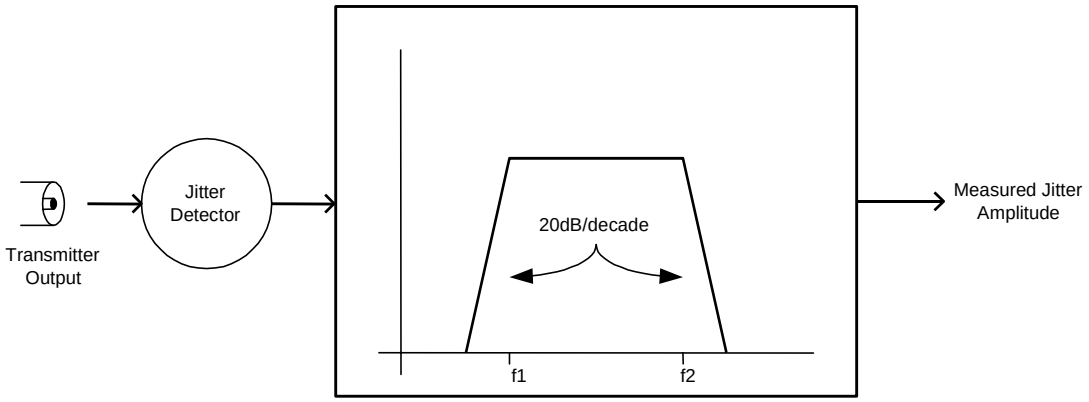
STS-1 (Transmit template specs)

Time axis range (T)	Normalized amplitude equation (A)
UPPER CURVE	
$-0.85 \leq T \leq -0.68$	0.03
$-0.68 \leq T \leq 0.26$	$0.03 + 0.5\{1+\sin[(\pi/2)(1+T/0.34)]\}$
$0.26 \leq T \leq 1.4$	$0.1+0.61\ e^{-2.4(T-0.26)}$
LOWER CURVE	
$-0.85 \leq T \leq -0.38$	-0.03
$-0.38 \leq T \leq 0.36$	$-0.03 + 0.5\{1+\sin[(\pi/2)(1 + T/0.18)]\}$
$0.36 \leq T \leq 1.4$	-0.03

ELECTRICAL SPECIFICATIONS (continued)

TRANSMITTER OUTPUT JITTER

The transmit jitter specification ensures compliance with ITU-T G.823 and G.824, Telcordia GR-499 CORE(I) and GR-253-CORE, and ANSI T1.102-1993 for all supported rates. Transmit output jitter is guaranteed only if a clean SONET quality transmit clock source is used.



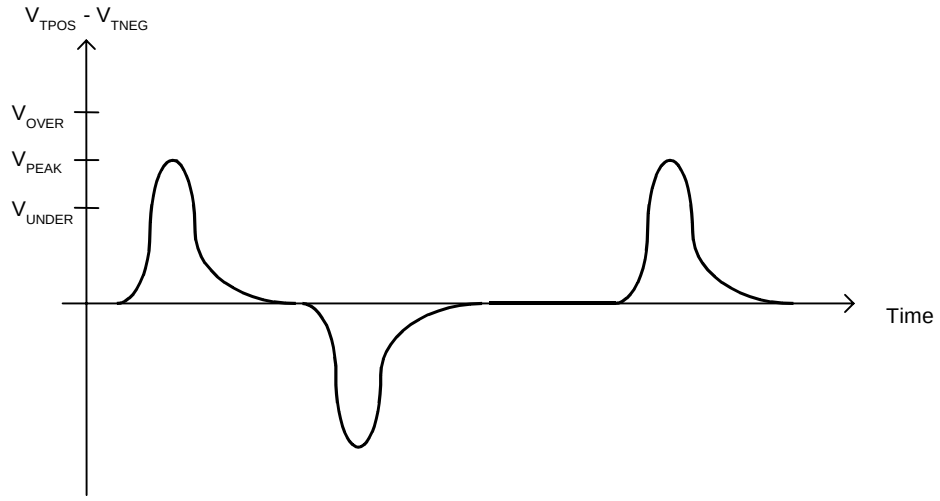
PARAMETER	CONDITION	MIN	NOM	MAX	UNIT
Transmitter Output Jitter	10 Hz to 800 kHz			0.15	UIpp
	10 kHz to 800 kHz			0.08	UIpp

Note: Filters defined by standards are used for all testing

ELECTRICAL SPECIFICATIONS (continued)

TRANSMIT MONITOR SPECIFICATIONS

The transmit monitor function looks at the signals on the LOUTPx and LOUTNx pins and checks for the existence of a valid signal. The monitor detects the peak of the transmitted signal at the LOUTPx and LOUTNx pins and checks that it is between V_{UNDER} and V_{OVER} at all times. If the peak level is within the voltage threshold window, the TXNW signal is low. If the peak level falls outside of the threshold limits for more than approximately 25 bit times, the TXNW signal goes high.



PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
V_{UNDER}	DS3/STS-1 mode with LBOx=1		450		mVpk
	E3 mode; DS3/STS-1 mode with LBOx=0		550		mVpk
V_{OVER}	DS3/STS-1 mode with LBOx=1		1050		mVpk
	E3 mode; DS3/STS-1 mode with LBOx=0		1480		mVpk

ELECTRICAL SPECIFICATIONS (continued)

DS3/STS-1 -- RECEIVER SPECIFICATIONS (Transformer-coupled)

PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Peak Differential Input Amplitude, LINPx and LINNx (see Note 1)	MON=0; Signal at DSX is 360-850 mVpk. (see Note 2)	90		850	mVpk
	MON=1 (see Note 3)	25		80	mVpk
	MON=0; DS3-HIGH (see Note 4)	90		1200	mVpk
Flat-loss Tolerance	MON=0. All valid cable lengths.	0		6	dB
Receive Clock Jitter	DS3 mode with 10 Hz – 400 kHz a) Normal receive mode b) Remote loopback mode			0.1 0.06	UIpp UIpp
Interfering Tone Tolerance (see Note 5)	Maximum ratio of Interference Power to Signal Power for BER < 10^{-8} a) With 0ft cable from DSX b) With 450ft cable from DSX		 -9 -10		 dB dB

Note 1: Signal source should meet DS3 template of ANSI-T102.1993 Figure 4 and STS-1 template of ANSI-T102.1993 Figure 5. Loss characteristics of the WE728A or RG59B cable should be better than Figure C2 of ANSI-T102.1993.

Note 2: Min spec corresponds to minimum DSX amplitude, 5.5dB of cable loss (450ft) and 6dB of flat attenuation. Error-free receiver performance is guaranteed for up to 600ft of cable from DSX cross-connect. Typical part can handle up to 900ft.

Note 3: Min spec corresponds to amplitude of 425mVpk at DSX, 5.5dB of cable loss (450ft) and 20dB of flat attenuation. In monitor mode, interfering tone performance is not guaranteed.

Note 4: In this mode, no noise, jitter, or interfering tone impairments should be added for guaranteed receiver performance.

Note 5: Interfering signal is a non-synchronous sinusoidal tone of 22.368MHz for DS3 or 25.92MHz for STS-1. Data is a PRBS15 (2^{15}-1) pattern.

ELECTRICAL SPECIFICATIONS (continued)

E3 – RECEIVER SPECIFICATIONS (Transformer-coupled)

PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Peak Differential Input Amplitude, LINPx and LINNx	MON=0 (See Note 1)	120		1200	mVpk
	MON=1 (See Note 2)	25		100	mVpk
Flat-loss Tolerance	MON=0. All valid cable lengths.	0		6	dB
Receive Clock Jitter	With 100Hz-800kHz filter: a) Normal receive mode b) Remote loopback mode			 0.1 0.06	 UIpp UIpp
Interfering Tone Tolerance (see Note 3)	Maximum ratio of Interference Power to Signal Power for BER < 10^{-8} a) With 0ft cable b) With 900ft cable		 -9 -10		 dB dB

Note 1: Min spec corresponds to signal amplitude of 950mVpk at source, 12dB of cable loss (1100ft) and 6dB of flat attenuation. Error-free receiver performance is guaranteed for all cable less than 1100ft. Typical part can handle up to 1350ft.

Note 2: Min spec corresponds to signal amplitude of 1000mVpk at source, 12dB of cable loss (1100ft) and 20dB of flat attenuation. In monitor mode, interfering tone performance is not guaranteed.

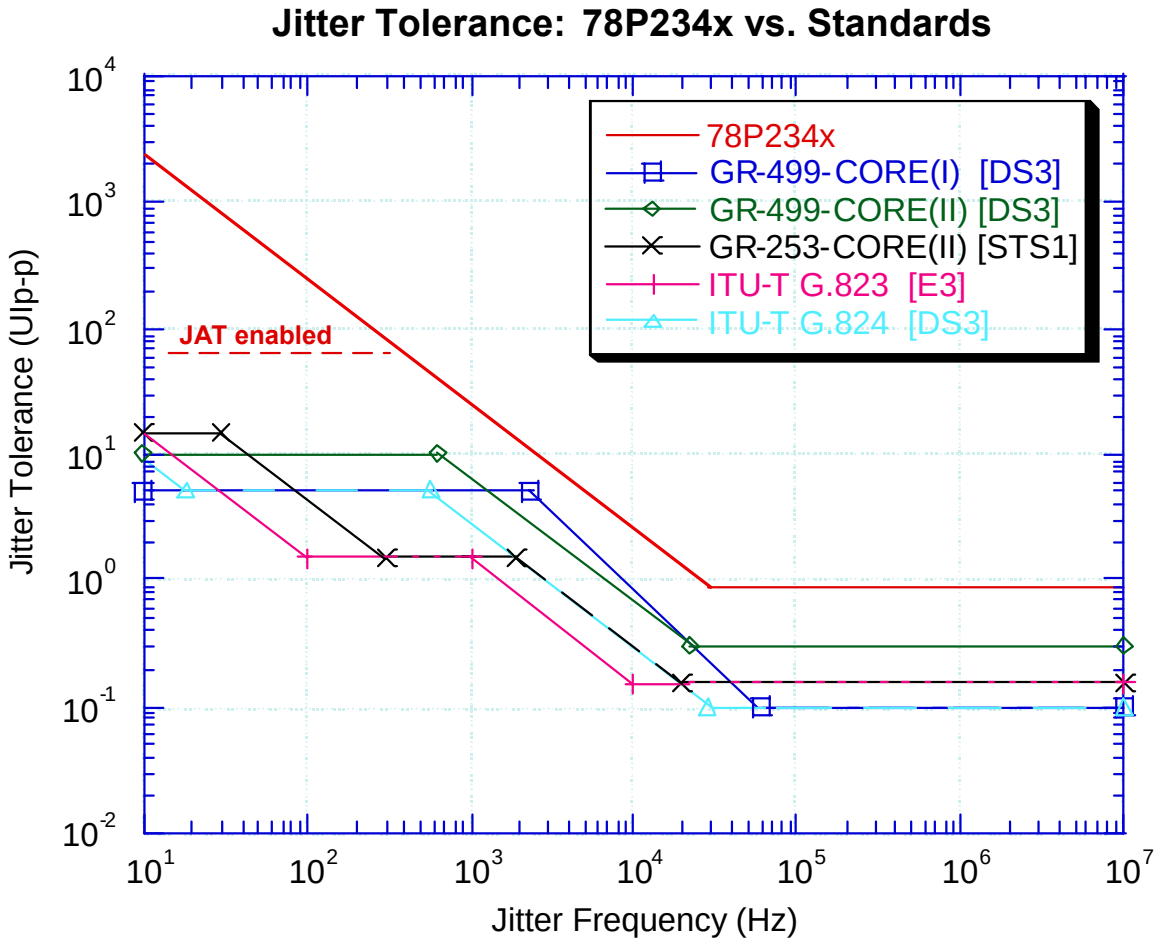
Note 3: Interfering signal is a non-synchronous E3 signal of the specified power level below the desired E3 signal. Both data and interfering signals are PRBS23 (2^{23}-1) pattern.

ELECTRICAL SPECIFICATIONS (continued)

RECEIVER JITTER TOLERANCE

The 78P2343JAT receive jitter tolerance exceeds all specifications as shown on the graph below.

PARAMETER	CONDITION	MIN	NOM	MAX	UNIT
Receiver High Frequency Jitter Tolerance	> 60 kHz	0.75			UIpp

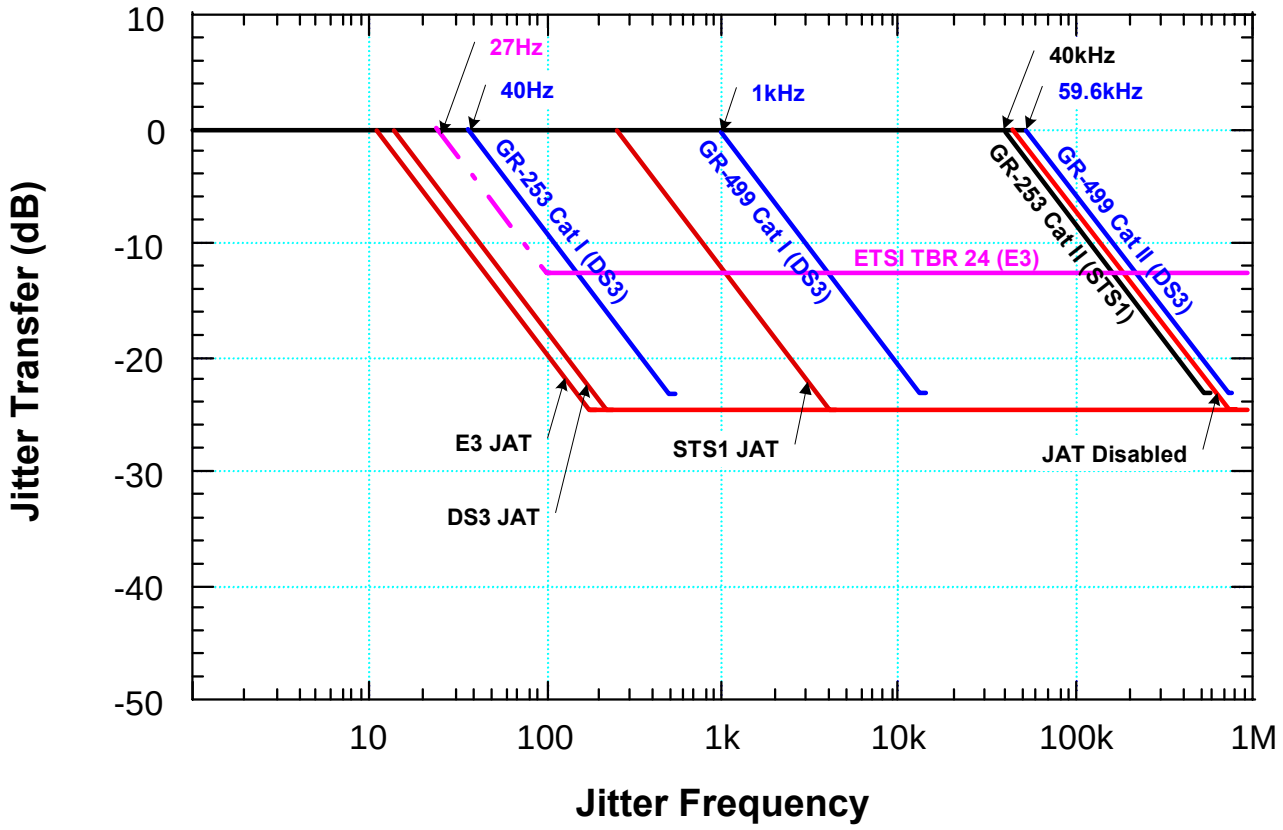


ELECTRICAL SPECIFICATIONS (continued)

RECEIVER JITTER TRANSFER FUNCTION

The receiver clock recovery loop characteristics are such that the receiver has the following transfer function. When the Jitter Attenuator (JAT) is enabled in the receive or transmit path, the receiver or transmitter will exhibit a jitter transfer as shown in the graph and table below. Jitter Attenuator operation is guaranteed through digital scan testing. The actual jitter transfer is guaranteed by logic design and is not tested during production testing.

PARAMETER	CONDITION	MIN	NOM	MAX	UNIT
Receiver Jitter transfer function	Below Fc			0.1	dB
Receiver Jitter Bandwidth, Fc	At –3dB point JABW= 0, E3 mode (default) JABW= 1, E3 mode JABW= 0, DS3 mode (default) JABW= 1, DS3 mode JABW= 0, STS1 mode JABW= 1, STS1 mode (default)			 13 188 17 245 20 283	Hz
	JAEN= 0, JAT disabled			55	kHz
Jitter transfer function roll-off	After Fc	20			dB per decade



APPLICATION INFORMATION

EXTERNAL COMPONENTS:

COMPONENT	PIN(S)	VALUE	UNITS	TOLERANCE
Receiver Termination Resistor	LINPx LINNx	84.5	Ω	1%
Transmitter Termination Resistor	LOUTPx LOUTNx	402	Ω	1%

TRANSFORMER SPECIFICATIONS:

COMPONENT	VALUE	UNITS	TOLERANCE
Turns Ratio for the Receiver		1:1	
Turns Ratio for the Transmitter (center-tapped)		1:2CT	

Suggested Manufacturer: Pulse, Tamura, Halo
