Disclaimer

Nanotron Technologies GmbH believes the information contained herein is correct and accurate at the time of release. Nanotron Technologies GmbH reserves the right to make changes without further notice to the product to improve reliability, function or design. Nanotron Technologies GmbH does not assume any liability or responsibility arising out of this product, as well as any application or circuits described herein, neither does it convey any license under its patent rights.

As far as possible, significant changes to product specifications and functionality will be provided in product specific Errata sheets, or in new versions of this document. Customers are encouraged to check the Nanotron website for the most recent updates on products.

Trademarks

nanoNET® is a registered trademark of Nanotron Technologies GmbH. All other trademarks, registered trademarks, and product names are the sole property of their respective owners.

Life Support Policy

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Nanotron Technologies GmbH customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nanotron Technologies GmbH for any damages resulting from such improper use or sale.

Electromagnetic Interference / Compatibility

Nearly every electronic device is susceptible to electromagnetic interference (EMI) if inadequately shielded, designed, or otherwise configured for electromagnetic compatibility.

To avoid electromagnetic interference and/or compatibility conflicts, do not use this device in any facility where posted notices instruct you to do so. In aircraft, use of any radio frequency devices must be in accordance with applicable regulations. Hospitals or health care facilities may be using equipment that is sensitive to external RF energy.

With medical devices, maintain a minimum separation of 15 cm (6 inches) between pacemakers and wireless devices and some wireless radios may interfere with some hearing aids. If other personal medical devices are being used in the vicinity of wireless devices, ensure that the device has been adequately shielded from RF energy. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

CAUTION! Electrostatic Sensitive Device. Precaution should be used when handling the device in order to prevent permanent damage.

1 Chip Summary

The *nanoNET chip* is a low-power, highly integrated mixed signal chip utilizing Nanotron's unique wireless Chirp Spread Spectrum (CSS) communication technology.

This innovative modulation technique permits the development of chips that have extremely low power consumption, operate over a wide range of temperatures, and perform effortlessly in robust wireless networks operating in the 2.45 GHz ISM band.

This chip offers an ideal solution for battery powered applications that require a reliable and extremely long operating lifetime, such as several years.

For communication over the air, CSS uses Upchirps and Downchirps with a symbol duration of $T_{symbol} = 1 \mu s$ and an effective bandwidth of $B_{chirp} = 64 \text{ MHz}$.

A wide variety of systems and applications can be developed with this novel technology, with the additional advantage of being able to select from data rates of either 500 kbps, 1 Mbps, or 2 Mbps.

Conveniently, only a minimal number of external components are required to build a fully operational bi-directional communication node.

Target Applications

Industries that can benefit from *nanoNET*'s robust, reliable communication include, but are not limited to:

1 Chip Summary

nanoNET TRX Transceiver (NA1TR8) Datasheet

1.1 Quick Reference Data

Table 1: Quick reference data

Parameter	Value	Unit
Maximum supply voltage	3.6	V
Minimum supply voltage	2.4	V
Maximum output power	8	dBm
Maximum data rate	2	Mbps
Typical receiver sensitivity at nominal conditions ^a	-92	dBm
Typical receiver sensitivity @ 2 Mbps	-86	dBm
Typical supply current		
In transmit mode @ -15 dBm output power & nominal conditions ^a	58	mA
In transmit mode @ -5 dBm output power & nominal conditions ^a	64	mA
In receive mode & nominal conditions ^a	35	mA
In standby mode with active RTC ^b	1.5	µA
Operating temperature range	-40 to +85	°C
Typical Operating Voltages		
Typical power supply voltage V _{DDA} (analog block)	3	V
Typical power supply voltage V _{DDD} (digital block)	3	V
Modulation method	Chirp	—
Operating frequency range		
Minimum	2400	MHz
Typical	2441.750	MHz
Maximum	2483.5	MHz

1.2 Block Diagram – Simplified

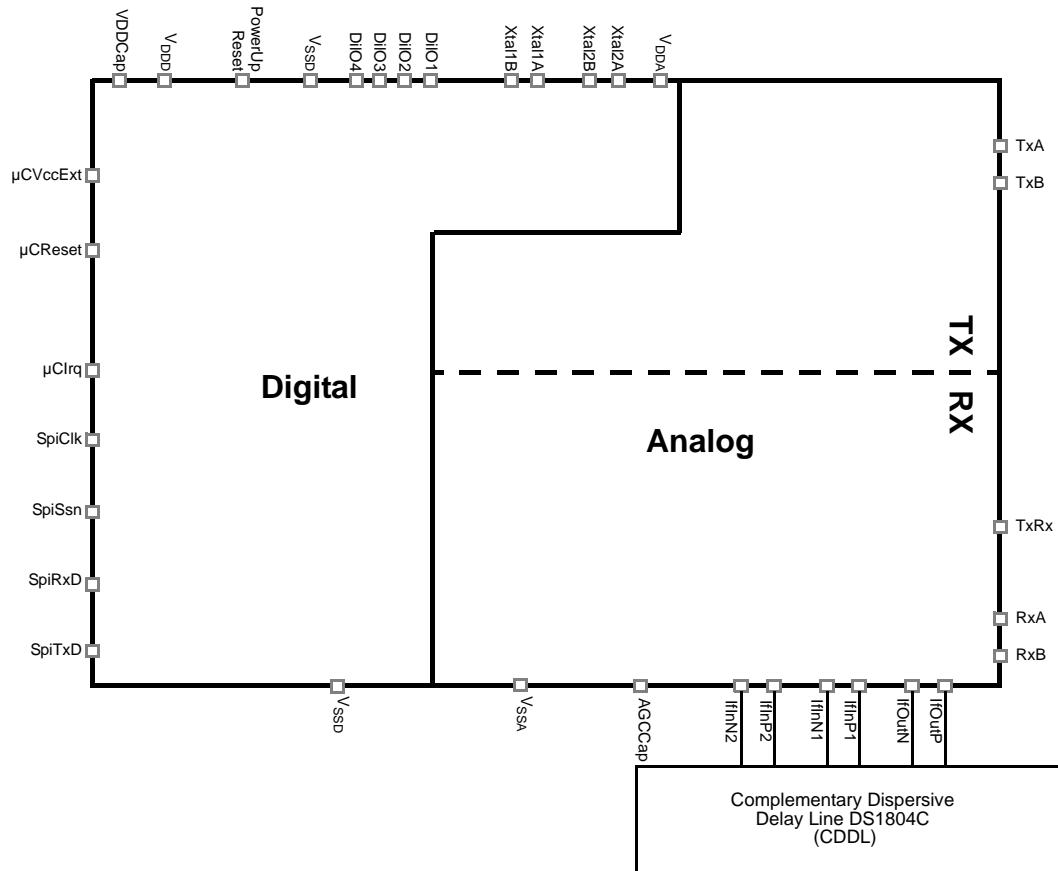

Figure 1: nanoNET TRX (NA1TR8) block diagram - simplified

1.3 Sample Application

The following application is an example of the *nanoNET TRX Transceiver* used with a temperature measurement and control device.

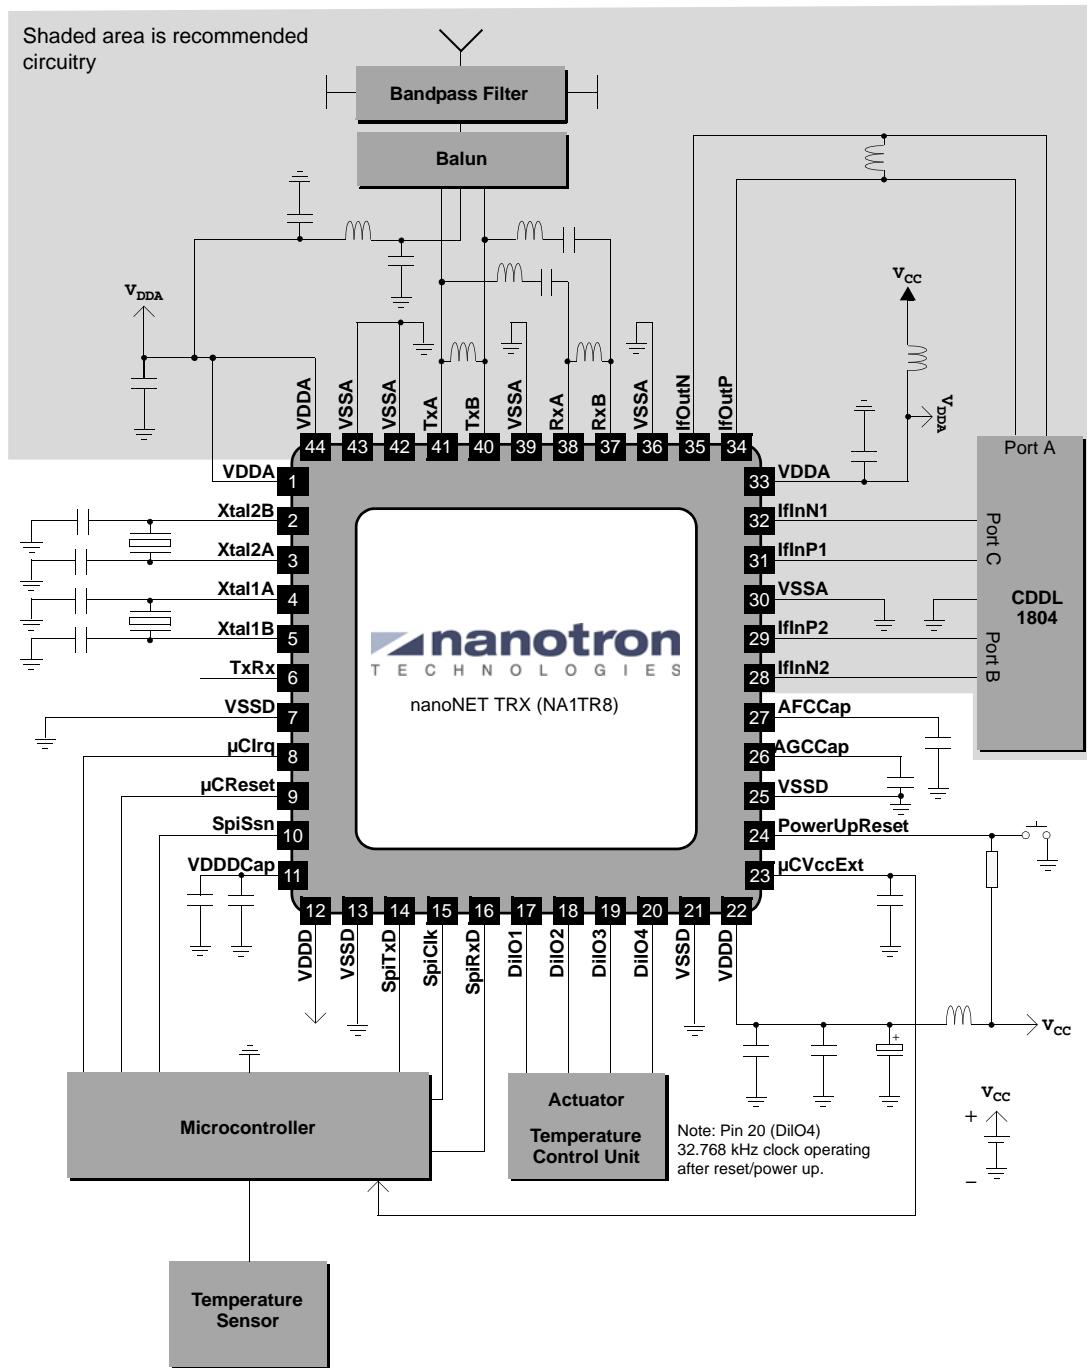

Figure 2: Example application showing recommended circuitry

Note: A full description of the sample application and PCB layout is provided in Appendix 1: *Sample Application* on page 27.

2 General Description

The *nanoNET* IC is a extremely low power, highly integrated mixed signal chip utilizing Chirp Spread Spectrum (CSS), a novel wireless communication technology developed by *Nanotron Technologies*.

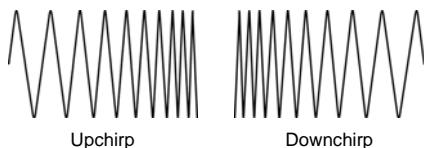

Fully Integrated Chip

The *nanoNET* chip is a fully integrated transceiver consisting of:

- a complete analog receiver (from antenna input to the demodulated digital data output).
- a complete transmitter (from digital data input to RF power amplifier output which can be directly connected to the antenna input) with additional support for an external power transistor. An external transistor or amplifier can boost transmission power from, for example, +8 dBm to +20 dBm (6.3 mW to 100 mW respectively).
- a programmable digital controller communicating with an external microcontroller via a serial peripheral interface (SPI). This controller incorporates a baseband controller and a Medium Access Controller (MAC). The baseband controller performs the processing of data (framing, error correction, en/decryption, and so on) while the MAC controller applies CSMA/CA, TDMA or hybrid-access schemes for medium access.

About Chirp Spread Spectrum

Using CSS, this chip produces Upchirps and Downchirps with a symbol duration of $T_{symbol} = 1\mu s$ and an effective frequency bandwidth of $B_{chirp} = 64$ MHz. CSS enables the development of different systems where application software can select physical data rates of 500 kbps, 1 Mbps, or 2 Mbps.

This IC is designed in such a way that only a minimum number of external elements are required to develop a fully operational bi-directional wireless communication node. Even very slow microcontrollers can work together with this high speed transceiver, due to its use of FIFOs (First In, First Out).

The *nanoNET* chip provides two buffers (a 1024 bit receive buffer and a 1024 bit transmit buffer) dedicated to storing the payload of either received packets or ready to be transmitted data packets. These buffers can be accessed independently of each other – the receive buffer can receive data from the antenna while the transmit buffer can simultaneously be filled with data for the next packet transmission.

Programmable Digital Support Block

A programmable support block is provided, which consists of a real time clock, wake up circuitry, power management, low battery voltage measurement, and several adjustment and calibration functions for the analog part of the transceiver.

The digital IO pin number 4 (DilO4) on the chip provides a 32.768 kHz clock for use by an external microcontroller on chip startup. It can be switched off after power up if not needed or it can be programmed to operate in another frequency (32.768 kHz or from 125 kHz to 16 MHz). Furthermore, the three other digital IO pins (DilO1, DilO2, DilO3) provided by the chip can also be programmed to operate in a frequency in the same range as DilO4.

Moreover, all important functions of this block can be setup and controlled by an application software. A *Receive Signal Strength Indicator* (RSSI) is also provided, which can be supported and controlled by the application. This RSSI value is required when CSMA is implemented and can be used, for example, to indicate when the air interface is free or busy.

The bit processing methods of the *nanoNET* chip include:

- Scrambling
- CRC (Cyclic Redundancy Check) generation and checking (CRC types include: ISO/IEC3309, CCITT X.25, X.75, ETS 300 125 / IEC 60870-5-1 / CCITT-32)
- 128 bit encryption/decryption (stream cipher with support of one time pads)
- FEC (forward error correction) block coded

Scrambling, encryption/decryption, and FEC can be enabled by the application, while the CRC type is selectable.

Transmission power can be programmed by the application and can be reduced in steps (from maximum +8 dBm) in a range of $Gain \geq 35$ dB. This means that the transmission power can vary from -27 dBm to +8 dBm without any additional external power amplifier or attenuator.

Receiver Sensitivity

The sensitivity of the *nanoNET TRX Transceiver* is defined by the raw data mode (data not coded or encrypted in anyway) where $BER = 0.001$. Sensitivity is $P_{sensitivity} = -92$ dBm or better. For an isotropic antenna, link budget is equal to $A_{link_budget} = 100$ dB.

4 Absolute Maximum Ratings

Table 2: Absolute maximum ratings

Parameter	Value ^a	Units	Item
Maximum received power	-20	dBm	5.1
Temperatures			5.2
Operating temperature (operating ambient temperature range)	+85	°C	5.3
Operating junction temperature (operating junction temperature range in TX mode)	+95	°C	5.4
Operating junction temperature (operating junction temperature range in RX mode)	+90	°C	5.5
Storage temperature (storage temperature range)	+125	°C	5.6
Reflow solder temperature (lead-free package)	+242	°C	5.7
Total power dissipation	450	mW	5.8
Supply voltage (V_{DDA} , V_{DDD})	3.6	V	5.9

a. It is critical that the ratings provided in Absolute Maximum Ratings be carefully observed. Stress exceeding one or more of these limiting values may cause permanent damage to the device.

5 Nominal Conditions

Nominal conditions are as specified below, except otherwise specified:

- Reference design (for measurement purposes only) has been used. See *Reference Design* on page 33.
- $T_{junct} = 30^\circ C$
- $V_{SSA} = V_{SSD} = GND$
- $V_{DDA} = V_{DDD} = 3.0 V$
- Transmission/reception @ 1 Mbps and up/down chirp mode.
- Raw data mode: no CRC, no FEC, no encryption, no bit scrambling.
- BER = 0.001 during receive period.
- RF output power during transmit phase = 6.3 mW (+8 dBm) EIRP measured during continuous transmission.
- All RF ports are matched according to this specification.
- For range measurement, two identical nanoNET systems equipped with antennae representing 1.6 dBi gain have been used. Antennae with vertical E-polarization and omnidirectional horizontal radiation pattern have been used.
- Outdoor (open space) range measurement was performed on flat terrain, without vegetation higher than 0.2 m above ground, and without visible obstacles and other objects that could reasonably influence measurement results. Antennae for both nanoNET systems have been located 1.5 m above ground.
- Indoor range measurement was performed inside typical European office building where both nanoNET systems were located on the same floor.
- All RF powers (TX output power, RX sensitivity, etc.) are measured on the IC terminals (pins) under impedance matched conditions.

6 Pin Connections (MLF44 7X7 mm)

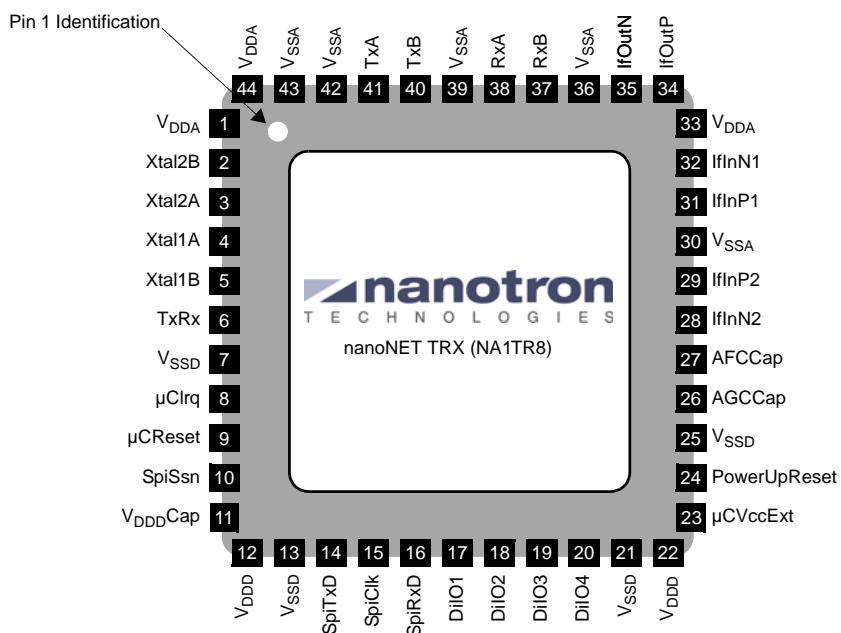

Figure 4: nanoNET TRX (MLF44) pin connections

Note: The pinning of the *nanoNET TRX Transceiver* described in this datasheet includes a 44 pin package. See *Package Dimensions* on page 23.

7 Pin Description

Table 3: nanoNET TRX Transceiver (NA1TR8) pin description

Pin	Name	Type	Description
1	V _{DDA}	–	Power supply for analog part.
2	Xtal2B	Input	Input for 32.768 kHz quartz oscillator.
3	Xtal2A	Input	Input for 32.768 kHz quartz oscillator.
4	Xtal1A	Input	Input for 16 MHz reference quartz oscillator.
5	Xtal1B	Input	Input for 16 MHz reference quartz oscillator.
6	TxRx	Output	External power amplifier control pin. Allows the use of an external amplifier. When activated by the register RfTxExtPampEnOutEn, this pin goes to low during TX mode. During non-transmit cycles, it has high-impedance. When not activated, it always has high-impedance.
7	V _{SSD}	–	Ground (digital).
8	μClrq	Output	Interrupt request to external microprocessor.
9	μCReset	Output	Reset for external microprocessor.

Table 3: nanoNET TRX Transceiver (NA1TR8) pin description

Pin	Name	Type	Description
10	SpiSsn	Input	Serial Peripheral Interface Slave Select (low active) is externally asserted before the microcontroller (master) can exchange data with the nanoNET TRX IC. Must be low before data transactions and must stay low for the duration of the transaction.
11	V _{DDD} Cap	–	V _{DDD} blocking capacitor pad used for blocking the internal digital power supply by at least one 100nF capacitor connected to VSSD.
12	V _{DDD}	–	Power supply for digital part.
13	V _{SSD}	–	Ground (digital).
14	SpiTxD	Output	Serial Peripheral Interface Transmit Data (MISO).
15	SpiClk	Input	Serial Peripheral Interface Clock is generated by the microcontroller (master) and synchronizes data movement in and out of the device through the SpiRxD and SpiTxD respectively.
16	SpiRxD	Input	Serial Peripheral Interface Receive Data (MOSI).
17	DlO1	Input/ Output	Digital Input or Output (programmable), line 1.
18	DlO2	Input/ Output	Digital Input or Output (programmable), line 2.
19	DlO3	Input/ Output	Digital Input or Output (programmable), line 3.
20	DlO4	Input/ Output	Digital Input or Output (programmable), line 4. Note: 32.768 kHz clock operating on this pin after reset/power up.
21	V _{SSD}	–	Ground (digital).
22	V _{DDD}	–	Power supply for digital part.
23	μCVccExt	Output	Power supply for external microprocessor
24	Power UpReset	Input	Power up reset line.
25	V _{SSD}	Input	Ground (digital).
26	AGCCap	–	Capacitor for AGC.
27	AFCCap	–	Capacitor for AFC.
28	IflnN2	Input	IF Input (channel 2, down-chirp) - connected to port B of Complementary Dispersive Delay Line (CDDL), line N.
29	IflnP2	Input	IF Input (channel 2, down-chirp) - connected to port B of Complementary Dispersive Delay Line (CDDL), line P.
30	V _{SSA}	–	Ground (analog).

7 Pin Description

nanoNET TRX Transceiver (NA1TR8) Datasheet

Table 3: nanoNET TRX Transceiver (NA1TR8) pin description

Pin	Name	Type	Description
31	IfInP1	Input	IF Input (channel 1, up-chirp) - connected to port C of Complementary Dispersive Delay Line (CDDL), line P.
32	IfInN1	Input	IF Input (channel 1, up-chirp) - connected to port C of Complementary Dispersive Delay Line (CDDL), line N.
33	V _{DDA}	–	Power supply for analog part.
34	IfOutP	Output	IF Output - connected to port A of Complementary Dispersive Delay Line (CDDL), line P.
35	IfOutN	Output	IF Output - connected to port A of Complementary Dispersive Delay Line (CDDL), line N.
36	V _{SSA}	–	Ground (analog).
37	RxB	Input	Receiver input.
38	RxA	Input	Receiver input.
39	V _{SSA}	–	Ground (analog).
40	TxB	Output	Transmitter output.
41	TxA	Output	Transmitter output.
42	V _{SSA}	–	Ground (analog).
43	V _{SSA}	–	Ground (analog).
44	V _{DDA}	–	Power supply for analog part.

8 Electrical Specifications

8.1 General DC Parameters

Table 4: General DC parameters

Parameter	Min	Typical	Max	Unit
Operating frequency range	2400	2441.750	2483.5	MHz
Supply voltage range $V_{DDA} \equiv V_{DDD}$	2.4	3.0	3.6	V
Modulation method	–	Chirp	–	–
Operating temperature range	-40	+25	+85	°C
Supply current ^a				
Power down (Internal Real Time Clock Active)	–	1.5	4	µA
Power up	–	150	200	µA
Standby	–	2.4	2.6	mA
Ready	–	9.6	10.5	mA
RX (up/down)	–	35	–	mA
TX ($P_{out} = +8 \text{ dBm}$)	–	82	–	mA
Supply Voltage				
V_{DDA} supply voltage	2.4	3	3.6	V
V_{DDD} supply voltage	2.4	3	3.6	V
V_{IL} (low level input voltage) ^b	-0.3	–	0.8	V
V_{IH} (high level input voltage) ^b	2.0	–	$V_{DDD} + 0.3$	V
V_{OL} (low level output voltage)	–	–	0.4	V
V_{OH} (high level output voltage)	2.4	–	–	V
I_{OH} (high output current)	-2	–	–	mA
I_{OL} (low output current)	2	–	–	mA

a. Under nominal conditions, except otherwise specified.

b. Given only for $V_{dd} = 3.0$ to 3.6

8 Electrical Specifications

nanoNET TRX Transceiver (NA1TR8) Datasheet

8.2 Transmitter (TX) Parameters

Under nominal conditions unless specified. See *Nominal Conditions* on page 7.

Table 5: Transmitter (TX) parameters

Parameter	Min	Typical	Max	Unit
Transmitter nominal output power ^a	6	8	–	dBm
Transmitter output power controlled in steps				
Dynamic for output power control	–	39	–	dB
Number of steps for output power control	–	19	–	–
Load impedance	–	150	–	Ω
Type of load	–	Balanced	–	
Transmitter spurious emissions ^b (1 GHz ... 12.5 GHz)	–	–	-80	dBm/Hz
Transmitter carrier suppression	–	-20	–	dBc
Carrier frequency	–	2441.750	–	MHz
Carrier frequency accuracy	-0.5	± 0.275	+0.5	MHz
Chirp sample frequency	–	244.175	–	MHz
Reference quartz oscillator				
Quartz operating frequency	–	16	–	MHz
Recommended accuracy	–	± 50	–	ppm
Maximum equivalent serial resistance of the quartz resonator	–	–	50	Ω
Load capacitance of quartz resonator	–	27	–	pF

- a. The transmitter output power is the average power related to the peak envelope power of the chirp waveform. (Due to shape of the waveform envelope, the measured average power of the chirp is about 1dB smaller than the peak envelope power.)
- b. The maximum transmitter output power has to be adjusted to ≤ 8 dBm to secure from overdrive.

8.3 Receiver (RX) Parameters

Under nominal conditions unless specified. See *Nominal Conditions* on page 7.

Note: The measurement results provided in this table were reached by using CDDL. For information on the CDDL, refer to the *Complementary Dispersive Delay Line Datasheet*.

Table 6: Receiver (RX) parameters

Parameter	Min	Typ	Max	Unit
Receiver sensitivity @ 1 Mbps	–	-92	–	dBm
Receiver sensitivity @ 2 Mbps	–	-86	–	dBm
Input impedance @ 2.44 GHz ^a	–	7-j56	–	Ω
Type of input	–	Balanced	–	–
Center frequency	–	2441.75	–	MHz
Gain from receiver input up to input to dispersive delay line (CDDL) ^a	–	64	–	dB
LO frequency	–	2691.75	–	MHz
LO frequency accuracy	-0.5	± 0.275	0.5	MHz
LO rejection noise P_{RX-LO} @ LNA input pin	–	–	-40	dBm
Programmable frequency step ^b	–	± 500	–	kHz
IF frequency (center)	–	250	–	MHz
IF frequency bandwidth (-3 dB) ^a (determined by CDDL)	90	–	–	MHz
IF output impedance (balanced) @ 250 MHz ^a	–	100	–	Ω
Type of IF output	–	Balanced	–	–
Impedance of IF input 1 (balanced) @ 250 MHz ^a	–	1.6	–	kΩ
Impedance of IF input 2 (balanced) @ 250 MHz ^a	–	1.6	–	kΩ
Type of IF1, IF2 input	–	Balanced	–	–
Maximum received power	–	–	-20	dBm

a. Simulated results.

b. The minimum change frequency of the LO.

8 Electrical Specifications

nanoNET TRX Transceiver (NA1TR8) Datasheet

8.4 Digital Interface Parameters

Under nominal conditions unless specified. See *Nominal Conditions* on page 7.

Table 7: Digital sensor/actuator interface parameters

Parameter	Value	Unit
Number of independent digital interfaces ^a	4	Number
Width of each interface	1	bit
Direction	Programmable	—

Table 8: Power management and sleep/wake-up circuitry parameters

Description	Min	Typical	Max	Unit
Turn-on time TX (user command received via SPI and begin of packet transmission)	–	24	–	μs
Turn-on time RX (user command received via SPI and begin of packet reception)	–	6	–	μs
Startup Time for 16 MHz XTAL until stable frequency generation	1.5	–	5	ms
Calibration time	–	≈2	–	ms

8.6 Interface to Digital Controller Parameters

Under nominal conditions unless specified. See *Nominal Conditions* on page 7.

Table 9: Interface to digital controller parameters

Symbol	Description	Min	Typical	Max	Unit	Notes
μCVccExt	High current output / high impedance Voltage @ 10mA load	VDD - 100	VDD - 20	VDD	mV	Maximum current output = 10mA / high impedance mode
μCReset	Push-pull, tristate	–	–	–	V	See footnote ^a
μCIRQ	Push-pull	–	–	–	V	See footnote ^a .
SpiRxD SpiClk, SpiSSn	Input	–	–	–	V	See footnote ^a
SpiTxD	Open-drain or push-pull	–	–	–	V	See footnote ^a

a. $V_{cc} = 2.4V : V_{OH} = 2.0V, V_{IH} = 1.7V, V_{OL} = 0.2V, V_{IL} = 0.7V,$
 $V_{cc} = 3.0..3.6V : V_{OH} = 2.4V, V_{IH} = 1.7..2.0V, V_{OL} = 0.2V, V_{IL} = 0.8V$

Note: Level translator is required for 5V logic level microcontroller.

8 Electrical Specifications

nanoNET TRX Transceiver (NA1TR8) Datasheet

Intentionally Left Blank

9 Timing Diagrams

Time values in the following diagrams are based on the values as shown in *Power Management and Sleep/Wake-Up Circuitry Parameters* on page 14.

9.1 Switch Time from TX to RX (from Ack to Data mode)

The switch time from TX to RX (from Ack to Data mode), $t_{TxRxAckData}$, is 24 μ s.

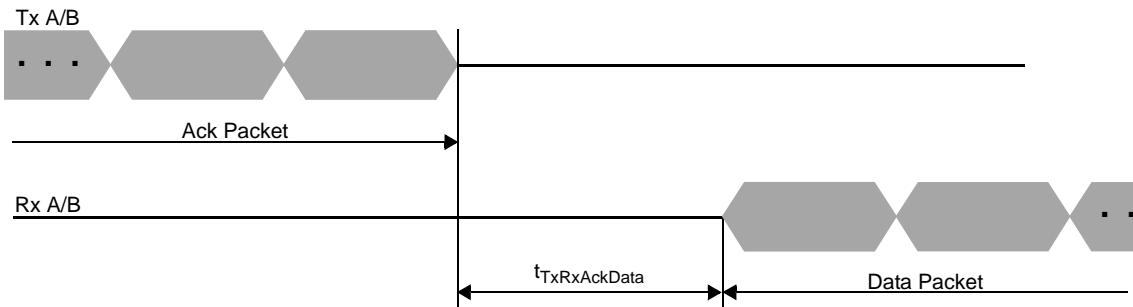

Figure 5: Switch time from TX to RX (from Ack to Data mode)

9.2 Switch Time from TX to RX (from Data to Ack mode)

The switch time from TX to RX (from Data to Ack mode), $t_{TxRxDataAck}$, is 8 μ s.

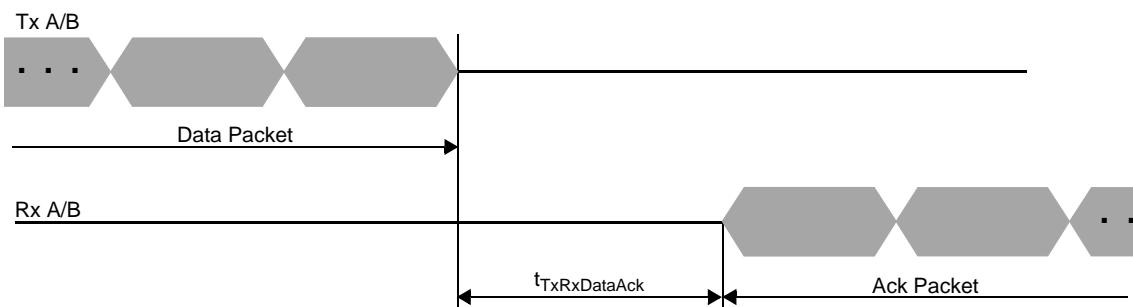

Figure 6: Switch time from TX to RX (from Data to Ack mode)

9.3 Switch Time from RX to TX (from Ack to Data mode)

The switch time from RX to TX (from Ack to Data mode), $t_{RxTxAckData}$, is 24 μ s.

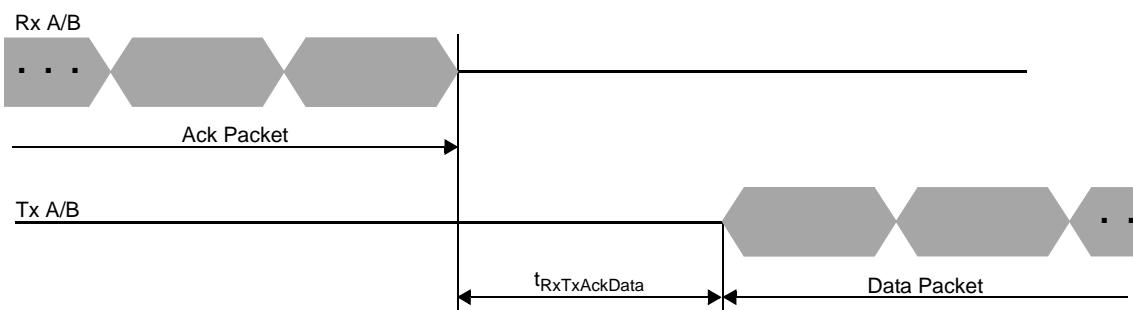

Figure 7: Switch time from RX to TX (from Ack to Data mode)

9 Timing Diagrams

nanoNET TRX Transceiver (NA1TR8) Datasheet

9.4 Switch Time from RX to TX (from Data to Ack mode)

The switch time from RX to TX (from Data to Ack mode), $t_{RxTxDataAck}$, is 8 μ s.

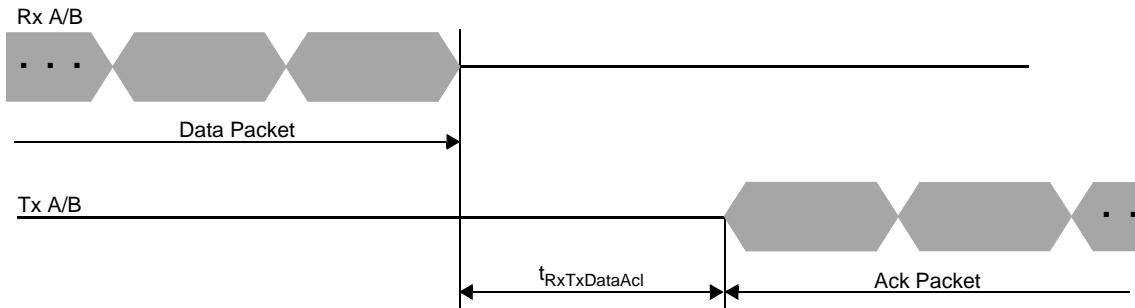

Figure 8: Switch time from RX to TX (from Data to Ack mode)

9.5 Turn-On Time TX

The Turn-on time for TX, t_{TxTO} , from the reception via SPI of a user command to the beginning of packet transmission is 24 μ s.

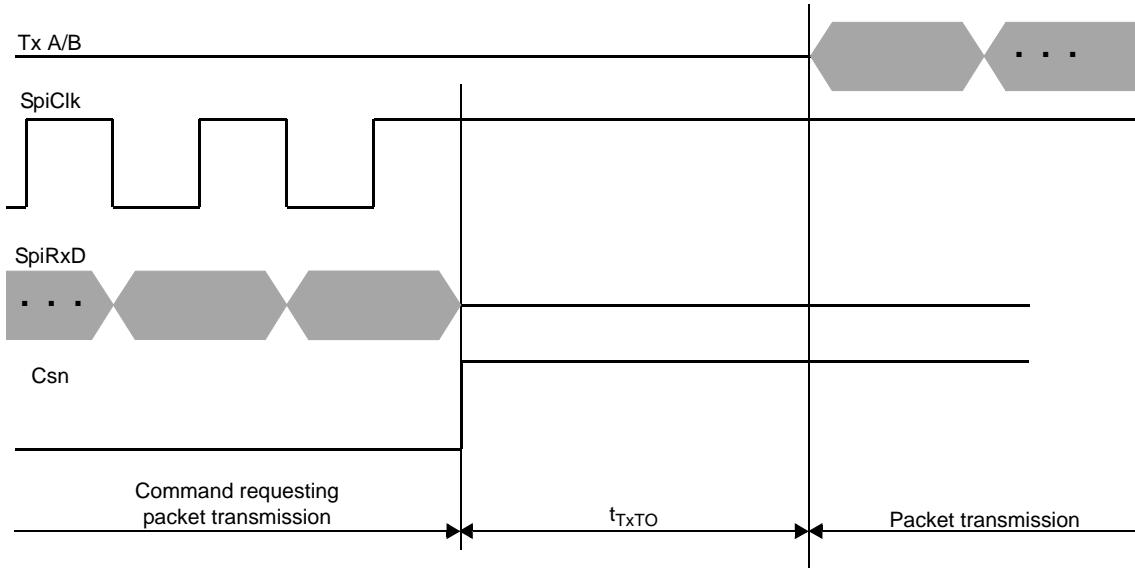

Figure 9: Turn-on time TX: time = t_{TxTO}

9.6 Turn-On Time RX

The Turn-on time for RX, t_{RxTO} , from the reception via SPI of a user command to the beginning of packet reception is 6 μ s.

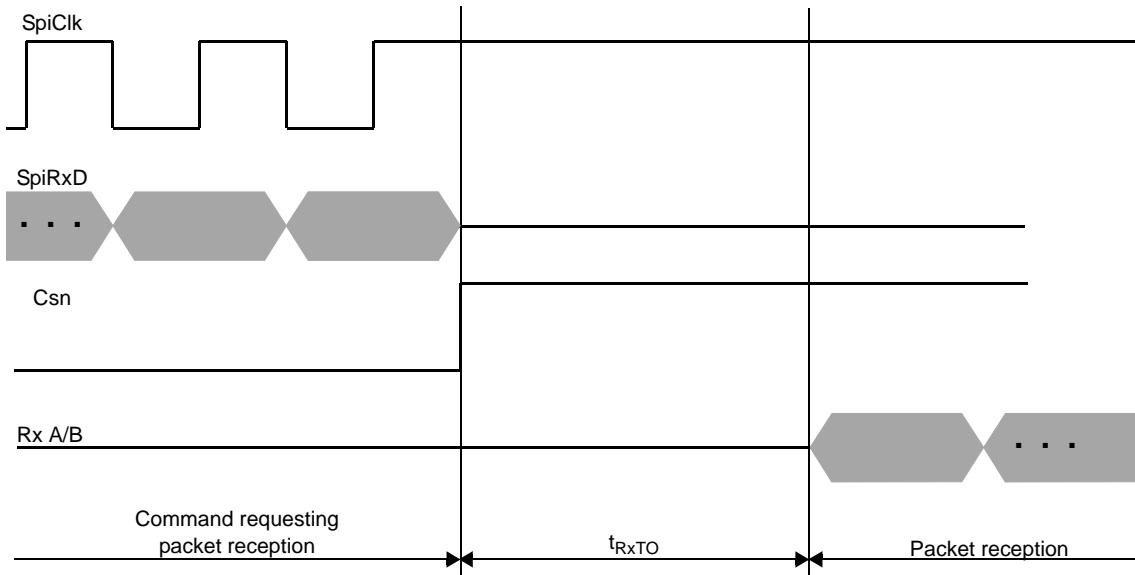

Figure 10: Turn-on time RX: time = t_{RxTO}

9.7 16 MHz Crystal Start-Up Time

The start-up time for the quartz oscillator until it reaches a stable frequency generation is within a range of 1.5 to 5 ms. See *Power Management and Sleep/Wake-Up Circuitry Parameters* on page 14.

9.8 LO Frequency Calibration Time

The time for the Local Oscillator frequency calibration, is approximately 2 ms. See *Power Management and Sleep/Wake-Up Circuitry Parameters* on page 14.

9.9 SPI Bus Read and Write Timing

The following timing diagrams shows the read and write timing of the SPI bus. For more details, see *nanoNET TRX Serial Peripheral Interface Specifications*.

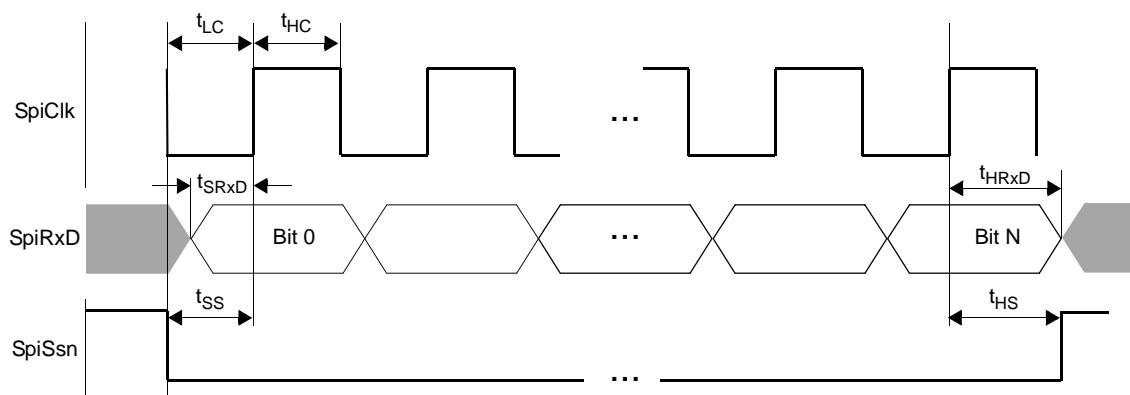

Figure 11: SPI bus write timing

9 Timing Diagrams

nanoNET TRX Transceiver (NA1TR8) Datasheet

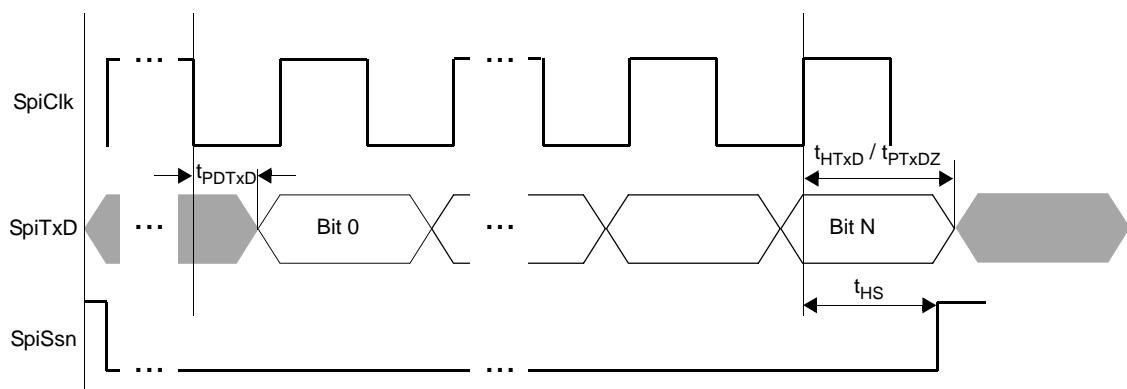

Figure 12: SPI bus read timing

The following table shows the SPI timing values.

Table 6: SPI timing values

Parameter	Min	Max	Comment
f_{max}	–	16 MHz	SpiClk
t_{LC}	22 ns	–	Low time SpiClk
t_{HC}	22 ns	–	High time SpiClk
t_{SS}	10 ns	–	SpiSsn Setup
t_{HS}	5 ns	–	SpiSsn Hold
t_{SRxD}	10 ns	–	SpiRxD Setup
t_{HRxD}	5 ns	–	SpiRxD Hold
t_{PDTxD}	–	18 ns	SpiTxD Propagation Delay Drive
t_{HTxD}	2 ns	–	SpiTxD Hold
t_{PTxDZ}	–	18 ns	SpiTxD Propagation Delay High Impedance

10 Output Power Control

The output power of the *nanoNET TRX Transceiver* can be set typically in a range of between -27 dBm to + 8 dBm. The following graphs show the range of possibilities. Nominal conditions except power supply voltage and RF output power.

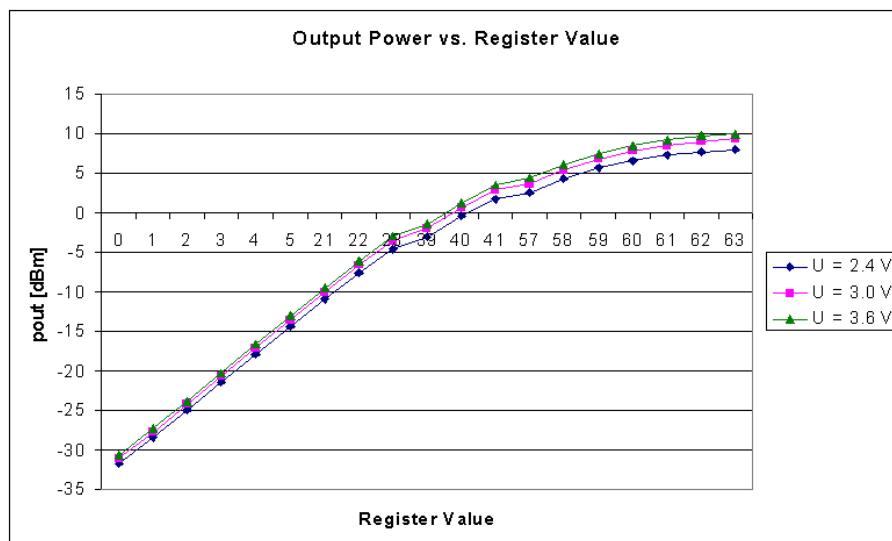

Figure 13: *nanoNET TRX output power (pout[dBm] by register value)*

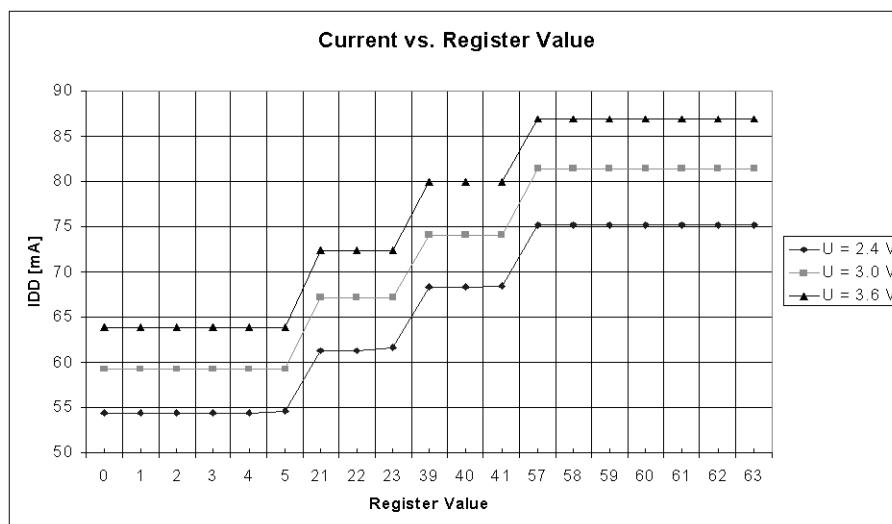

Figure 14: *Total current consumption (IDDA[mA] by register value)*

11 Package Dimensions

The following shows the dimensions of MLF44 44 Pin 7x7 lead-free package.

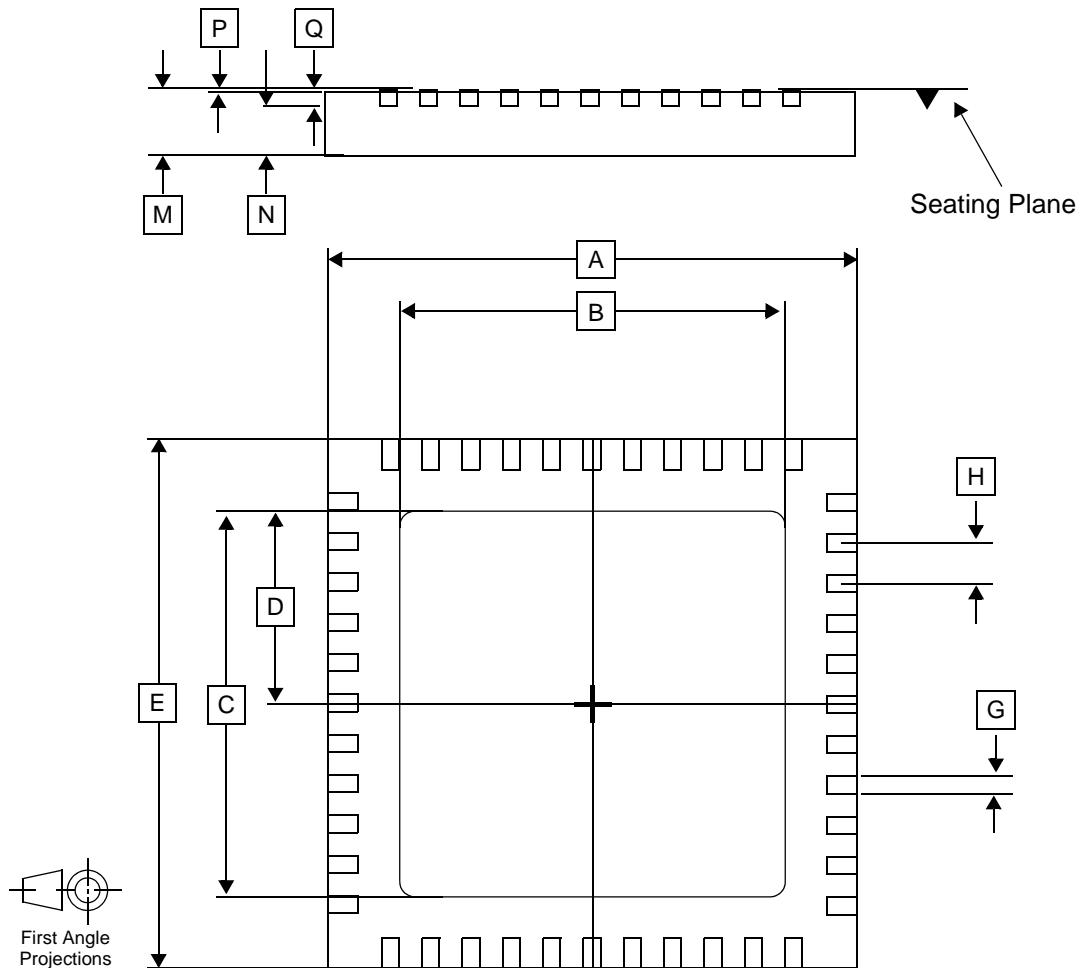

Figure 16: MLF44 7x7 package dimensions

Table 10: Package dimensions labels (unless specified, dimensions are in millimeters)

Label	Common Dimensions		
	Minimum	Nominal	Maximum
A		7.00	
B	4.55	4.70	4.85
C	4.55	4.70	4.85
D		C / 2	
E		7.00	
G	0.18	0.23	0.30
H		0.50	
M	0.80	0.9	1.00
N	—	0.65	0.80
P	0.00	0.02	0.05
Q		0.25	

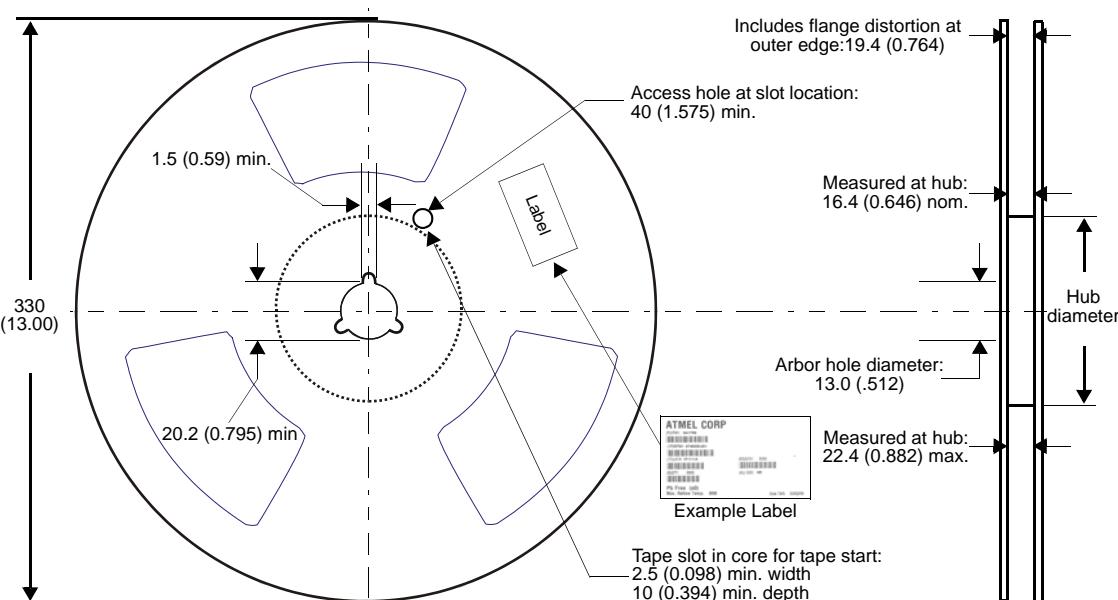

12 Tape and Reel Information

An embossed tape and reel is used to facilitate automatic pick and place equipment feed requirements. The tape is used as the shipping container for the *nanoNET TRX Transceiver (NA1TR8)* and requires a minimum of handling. The antistatic/conductive tape provides a secure cavity for the product when sealed with the peel-back cover tape.

12.1 Reel Dimensions

Reel Diameter	Units Per Reel	Reel and Hub Size ¹
13"	2,500	13/4

1. Reel and hub size = 13 inch reel with 4 inch hub.

Note: Dimensions are in millimeters (inches are in brackets for reference purposes only).

Figure 17: Reel dimensions

12.2 Tape Dimensions

Package Type	Number of Leads	Nominal Package Size	Carrier Tape Width	Carrier Tape Pitch	Leader/Trailer Length ¹
QFN (MLFP)	44	7 x 7 x 0.9 mm	16 mm	12 mm	EIA

1. The device loading orientation is in compliance with EIA-481.

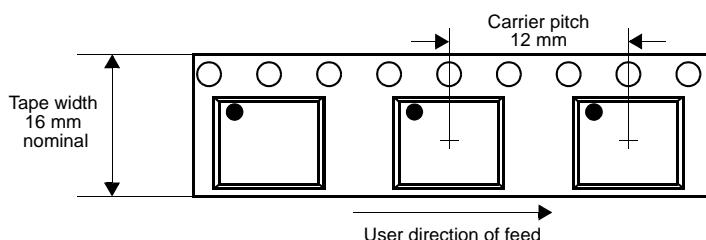

Figure 18: Tape dimensions

13 Ordering Information

To order the product described in this datasheet, use the following information.

Part Number	Package Type	Package Quantity	RoHS Compliant ¹
NA0108B	MLF 44 7x7 mm Tape and reel	16 x 12 type 2,500 pieces per tape	Yes. A certificate of RoHS compliance is available from Nanotron Technologies on request.

1. The RoHS directive is “The Restriction of Hazardous Substances in Electrical and Electronic Equipment (ROHS) Directive (2002/95/EC)”. The Directive aims to protect human health and the environment by restricting the use of certain hazardous substances in new equipment; and it complements the WEEE Directive.

13 Ordering Information

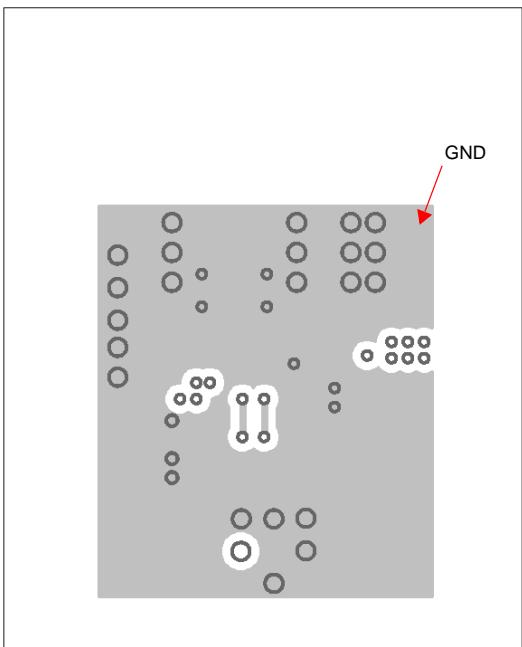

Figure 25: RF part: layer 3

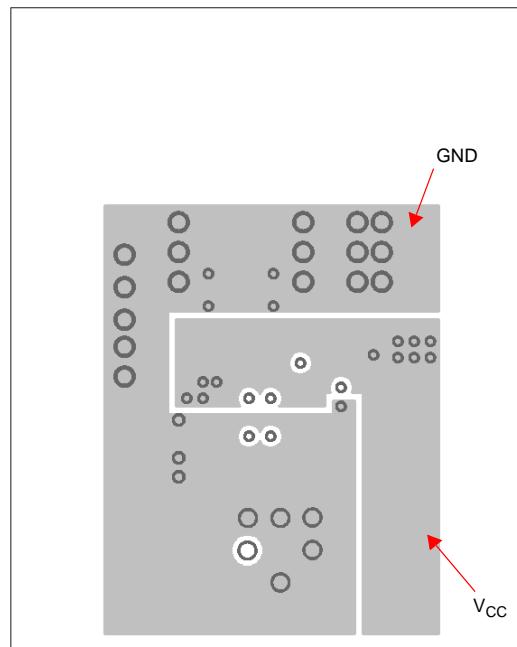

Figure 26: RF part: bottom layer

A1.3 Recommended PCB Layout for IF Part

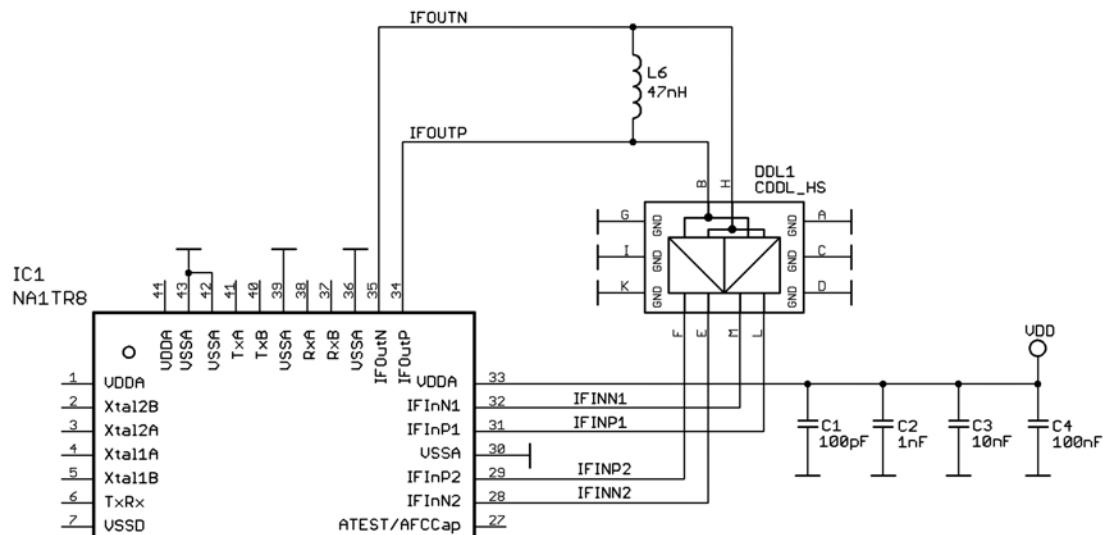

Figure 27: Recommended PCB layout for IF part: schematic 1 of 1

The following describes the layout requirements for the IF part:

- V_{SSA} pin is connected to the ground plane under the chip.
- Short connection between chip and CDDL, with minimal width of wires and minimal pad areas for minimal influence of PCB parasitics (do not implement 50 Ω microstrip).
- Equal lengths of traces for better CMRR.
- External coil (L1 = 47 nH) placed directly between the input pads of CDDL (PORT A).
- Use 4 layer PCB (top layer = layer 1, GND = inner layer 2, GND = inner layer 3, and bottom layer = layer 4).

Revision History

Version	Date	Description/Changes
1.00	2003-10-11	Initial Release from internal document.
1.01	2003-12-16	Updated images, chip designations on page 19, 20.
1.02	2004-01-28	Bill of Materials table updated and package dimensions added.
1.03	2004-03-15	New template added, BOM updated, Example Application updated.
1.04	2004-04-08	Example application diagram updated, BOM updated, minor textual changes. Title changed to Datasheet.
2.00	2004-08-09	Pinning has changed from 48 pins to 44 pins. The Pin diagram and descriptions have been changed accordingly. Layout suggestion of CDDL connection added. Current consumption for TX changed to 78 mA. Other minor changes.
2.01	2004-09-10	Datasheet updated to latest data. Minor textual changes. Document sign-off table added.
2.02	2004-09-17	Example application updated. BOM table updated.
2.03	2004-11-05	Block diagram updated.
2.04	2005-03-25	Parameters in this version for NA2TR1 chip. Nominal Conditions section added. General description updated. Modifications made to block diagram. Naming of Pin 2 and 3 corrected. Content of Absolute Maximum Ratings table modified. All parameters checked and reviewed. Example Application diagrams improved and updated. Both Bill of Materials tables modified. New section 10 added. Document status table added. Document status added.
2.05	2005-04-07	Chip values updated for NA1TR8. New feature: Programmable clock output at digital output.
2.06	2005-07-15	Template updated; Nominal conditions clarified (last point added); block diagram modified; term quartz oscillator used throughout; 32.768 kHz used throughout; V _{DDD} , V _{DDA} supply voltage typical added; Item 8.2.3 changed; timing diagrams added; output power graphs added; example application simplified and BOM deleted; new schematics and layout for recommended PCB layout for RF and IF part; RoHS directive data added; tape and reel information added; ordering information added; reference design appendix added. Note: The typical value for Item 8.1.10 supply current TX ($P_{out} = +8 \text{ dBm}$) has been updated from 78 mA to 82 mA.
2.06	2005-07-15	Item 7.11 updated - description of pin clarified; clock signal provided by chip clarified; error corrected in SPI bus read timing diagram (SpiTxD);
2.07	2005-10-21	Minor textual changes; clarification of clock signal that can be provided by the chip (i.e., 32.768 kHz or from 125 kHz to 16 MHz); description of pin 11 VDDCAP clarified; SpiTxD changed to SpiRxD in both Turn-on time RX and TX figures; error in SPI bus read timing figure fixed; Pin TxRx purpose clarified and elaborated; company address updated.
2.08	2007-02-20	Minor textual changes.
2.09	2007-12-20	Template changes; addition of chip summary section.

About Nanotron Technologies GmbH

Nanotron Technologies GmbH develops world-class wireless products for demanding applications based on its patented Chirp Spread Spectrum – an innovation that guarantees high robustness, optimal use of the available bandwidth, and low energy consumption. Since the beginning of 2005, Nanotron's Chirp technology has been a part of the IEEE 802.15.4a draft standard for wireless PANs which require extremely robust communication and low power consumption.

ICs and RF modules include the nanoNET TRX, the nanoLOC TRX, and ready-to-use or custom wireless solutions. These include, but are not limited to, industrial monitoring and control applications, medical applications (Active RFID), security applications, and Real Time Location Systems (RTLS). nanoNET is certified in Europe, United States, and Japan and supplied to customers worldwide.

Headquartered in Berlin, Germany, Nanotron Technologies GmbH was founded in 1991 and is an active member of IEEE, the ZigBee alliance, and ISA-SP100.
