Description

Spectrum Microwave's Series MDR5100 Phase Locked Oscillators use a Dielectric Resonator in the resonant circuit. The circuit is lightly loaded to obtain the lowest phase noise possible.

The resonator is epoxied to a printed circuit board and well grounded to minimize modulation sidebands during shock and vibration.

Buffer amplifiers are used to provide isolation from load VSWRs; Regulators filter noise on the DC input voltage.

External reference models are also available. A lock indicator circuit is provided to signal an out-of-lock condition.

Notes:

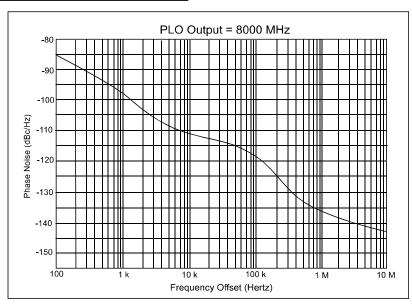

1. Specifications labeled "min." or "max." are guaranteed in a 50 Ohm system over the

- specified temperature range 2. Output frequency must be specified, and it is an integer multiple of the internal crystal reference frequency.
- Mechanical tuning of PLO in unlocked mode.
 Higher output power is available.
- 5. Phase Noise at offsets <100 kHz is dependent on external reference and can be approximated as follows: Phase Noise (dB) = 20log(N) +3 dB above the external reference phase noise, where N = multiple of reference.

6. Other input voltages are available

7. Actual or impending loss of lock.

8. Package must be verified by Spectrum Microwave.
