Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note: Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

Renesas Technology Corp. Customer Support Dept. April 1, 2003

MITSUBISHI MICROCOMPUTERS M37905F8CFP, M37905F8CSP

16-BIT CMOS MICROCOMPUTER

DESCRIPTION

These are single-chip 16-bit microcomputers designed with high-performance CMOS silicon gate technology, including the internal flash memory and, being packaged in 64-pin plastic molded QFP or shrink plastic molded DIP. These microcomputers support the 7900 Series instruction set, which are enhanced and expanded instruction set and are upper-compatible with the 7700/7751 Series instruction set. The CPU of these microcomputers is a 16-bit parallel processor that can also be switched to perform 8-bit parallel processing. Also, the bus interface unit of these microcomputers enhances the memory access efficiency to execute instructions fast. Therefore, these microcomputers are suitable for office, business, and industrial equipment controller that require high-speed processing of large data. Also, they are suitable for motor-control equipment since each of

For the internal flash memory, single-power-supply programming and erasure, using a PROM programmer or the control by the central processing unit (CPU), is supported. Also, each of these microcomputers has the memory area dedicated for storing a certain software which controls programming and erasure (reprogramming control software). Therefore, on these microcomputers, the program can easily be changed even after they are mounted on the board.

DISTINCTIVE FEATURES

them includes the motor control circuit.

<microcomputer mode=""></microcomputer>
• Number of basic machine instructions
Memory
Flash memory (User ROM area) 60 Kbytes
RAM
Flash memory (Boot ROM area) 8 Kbytes
• Instruction execution time
The fastest instruction at 20 MHz frequency 50 ns
• Single power supply 5 V ± 0.5 V
• Interrupts 8 external sources, 23 internal sources, 7 levels
• Multi-functional 16-bit timer
(Three-phase motor drive waveform or Pulse motor drive waveform
output is available.)
• Serial I/O (UART or Clock synchronous)
• 10-bit A-D converter
• 8-bit D-A converter2-channel outputs
• 12-bit watchdog timer
• Programmable input/output (ports P1, P2, P4, P5, P6, P7, P8) 50

<Flash memory mode>

Power supply voltage	5 V ± 0.5 V
• Programming/Erase voltage	5 V ± 0.5 V
Programming method	. Programming in a unit of word
Erase method	Block erase or Total erase
M37905F8CFP. M37905F8CSP	

...... 4 blocks (8 Kbytes X 2, 16 Kbytes X 1, 28 Kbytes X 1)

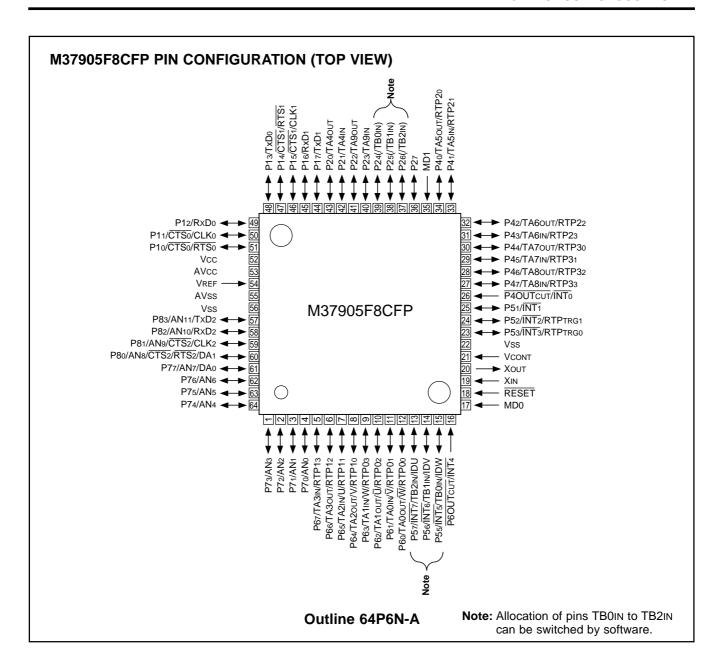

- Programming/Erase control by software command

APPLICATION

- Control devices for office equipment such as copiers and facsimiles
- Control devices for industrial equipment such as communication and measuring instruments
- Control devices for equipment, requiring motor control, such as inverter air conditioners and general-purpose inverters

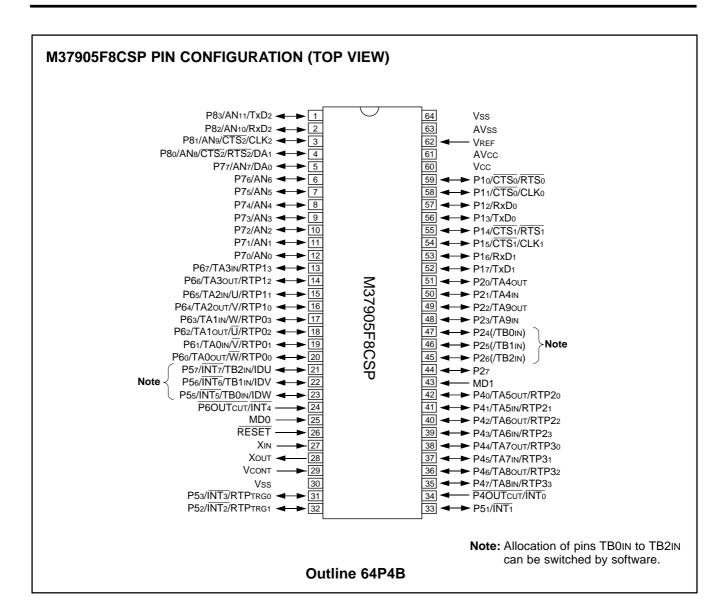

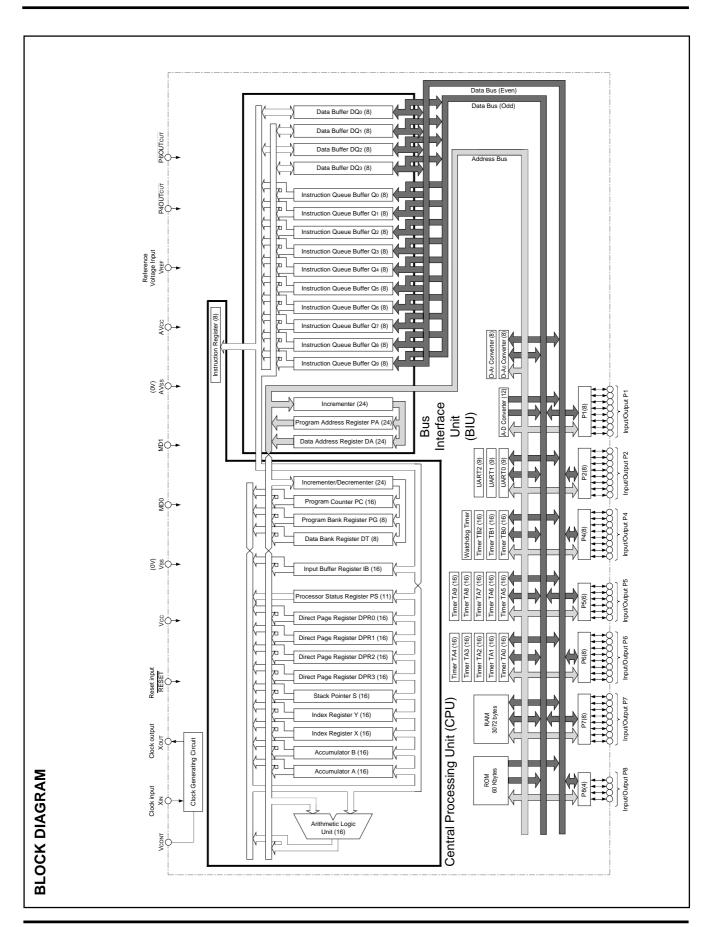

MITSUBISHI MICROCOMPUTERS M37905F8CFP, M37905F8CSP

16-BIT CMOS MICROCOMPUTER

FUNCTIONS (Microcomputer mode)

	Parameter	Functions		
Number of basic machine inst	ructions	203		
Instruction execution time		50 ns (the fastest instruction at f(fsys) = 20 MHz)		
External clock input frequency	f(XIN)	20 MHz (Max.)		
System clock frequency f(fsys)		20 MHz (Max.)		
Memory size	Flash memory (User ROM area)	60 Kbytes		
	RAM	3072 bytes		
	Flash memory (Boot ROM area)	8 Kbytes		
Programmable input/output	P1, P2, P4, P6, P7	8-bit × 5		
ports	P5	6-bit X 1		
	P8	4-bit X 1		
Multi-functional timers	TA0-TA9	16-bit X 10		
	TB0-TB2	16-bit X 3		
Serial I/O	UART0, UART1, and UART2	(UART or Clock synchronous serial I/O) X 3		
A-D converter		10-bit successive approximation method X 1 (12 channels)		
D-A converter		8-bit × 2		
Dead-time timer		8-bit × 3		
Watchdog timer		12-bit X 1		
Interrupts	Maskable interrups	8 external sources, 20 internal sources. Each interrupt can be to a priority level within the range of 0–7 by software.		
	Non-maskable interrups	3 internal sources.		
Clock generating circuit		Incorporated (externally connected to a ceramic resonator quartz crystal resonator).		
PLL frequency multiplier		The following multiplication ratios are available: X2, X3, X4.		
Power supply voltage		5 V±0.5 V		
Power dissipation		125 mW (at f(fsys) = 20 MHz, Typ., ; the PLL frequency multiplier is inactive.)		
Ports' input/output	Input/Output withstand voltage	5 V		
characteristics	Output current	5 mA		
Memory expansion		Not available (single-chip mode only).		
Operating ambient temperatur	re range	−20 to 85 °C		
Device structure		CMOS high-performance silicon gate process		
Package		(Note)		

Note:

Packages	M37905F8CFP	64-pin plastic molded QFP (64P6N-A)
	M37905F8CSP	64-pin shrink plastic moldeds DIP (64P4B)

16-BIT CMOS MICROCOMPUTER

PIN DESCRIPTION (MICROCOMPUTER MODE)

Pin	Name	Input/ Output	Functions
Vcc, Vss	Power supply input	_	Apply 5 V±0.5 V to Vcc, and 0 V to Vss.
MD0	MD0	Input	Connect this pin to Vss.
MD1	MD1	Input	Connect this pin to Vss.
RESET	Reset input	Input	The microcomputer is reset when "L" level is applies to this pin.
XIN	Clock input	Input	These are input and output pins of the internal clock generating circuit. Connect a
Хоит	Clock output	Output	ceramic resonator or quartz-crystal oscillator between pins XIN and XOUT. When an external clock is used, the clock source should be connected to pin XIN, and pin XOUT should be left open.
VCONT	Filter circuit connection	_	When using the PLL frequency multiplier, connect this pin to the filter circuit. When not using the PLL frequency multiplier, this pin should be left open.
AVcc, AVss	Analog power supply input	_	Power supply input pins for the A-D and D-A converters. Connect AVcc to Vcc, and AVss to Vss externally.
VREF	Reference voltage input	Input	This is the reference voltage input pin for the A-D and D-A converters.
P10-P17	I/O port P1	I/O	Port P1 is an 8-bit I/O port. This port has an I/O direction register, and each pin can be programmed for input or output. These pins enter the input mode ar reset. These pins also function as I/O pins of UARTO, 1.
P20-P27	I/O port P2	I/O	In addition to having the same functions as port P1, these pins function as I/O pins for timers A4 and A9. Also, they can be programmed to function as input pins for timers B0 to B2.
P40-P47	I/O port P4	I/O	In addition to having the same functions as port P1, these pins function as I/O pins for timers A5 to A8. Also, they function as output pins for motor drive waveform.
P51–P53, P55–P57	I/O port P5	I/O	In addition to having the same functions as port P1, these pins function as input pins for INT1 to INT3 and INT5 to INT7. Also, pins P55 to P57 function as input pins for timers B0 to B2 and as input pins for position data in the three-phase waveform mode; and pins P52 and P53 function as trigger-input pins in the pulse output port mode.
P60-P67	I/O port P6	I/O	In addition to having the same functions as port P1, these pins function as I/O pins for timers A0 to A3. Also, they function as motor drive waveform output pins.
P70-P77	I/O port P7	I/O	In addition to having the same functions as port P1, these pins function as input pins for the A-D converter. Also, P77 functions as an output pin for the D-A converter.
P80-P83	I/O port P8	I/O	In addition to having the same functions as port P1, these pins function as input pins for the A-D converter. Also, these pins function as I/O pins for UART2, and pin P80 functions as an output pin for the D-A converter.
P4OUTcut	P4OUTcuT input	Input	This pin has the function to forcibly place port P4 pins in the input mode. Also, this pin functions as an input pin for INTo; and this pin is used to input a signal, which forcibly cuts off a motor drive waveform output.
P6OUTcut	P6OUTcuT input	Input	This pin has the function to forci <u>bly place</u> port P6 pins in the input mode. Also, this pin functions as an input pin for INT4; and this pin is used to input a signal, which forcibly cuts off a motor drive waveform output.

16-BIT CMOS MICROCOMPUTER

PIN DESCRIPTION (FLASH MEMORY SERIAL I/O MODE)

Pin	Name	Input /Output	Functions
Vcc, Vss	Power supply input	_	Apply 5 V ± 0.5 V to Vcc, and 0 V to Vss.
MD0	MD0	Input	Connect this pin to Vss.
MD1	MD1	Input	Connect this pin to Vss via a resistor of 10 k Ω to 100 k Ω .
RESET	Reset input	Input	The reset input pin.
XIN	Clock input	Input	Connect a ceramic oscillator between the XIN and XOUT pins, or input an external
Хоит	Clock output	Output	clock from the XIN pin with the XOUT pin left open.
AVcc, AVss	Analog supply input	_	Connect AVcc to Vcc, and AVss to Vss.
VREF	Reference voltage input	Input	Input an arbitrary level within the range of VSS–VCC. (This is not used in the flash memory serial I/O mode.)
P10-P17	Input port P1	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P20-P23, P27	Input port P2	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P24	SCLK input	Input	This is an input pin for a serial clock.
P25	SDA I/O	I/O	This is an I/O pin for serial data. Connect this pin to Vcc via a resistor (about 1 kΩ).
P26	BUSY output	Output	This is an output pin for the BUSY signal.
P4OUTcut	P4OUTcut input	Input	Input "H".
P6OUTcut	P6OUTCUT input	Input	Input "H".
P40-P47	Input port P4	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P55-P53,	Input port P5	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P55-P57			
P60-P67	Input port P6	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P70-P74	Input port P7	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
P80-P83	Input port P8	Input	Input "H" or "L", or leave them open. (This is not used in the flash memory serial I/O mode.)
VCONT	Filter circuit connection	_	Connect this pin to the filter circuit, or leave this pin open. (This is not used in the flash memory serial I/O mode.)

16-BIT CMOS MICROCOMPUTER

BASIC FUNCTION BLOCKS

Each of the M37905F8CFP and M37905F8CSP has the same function as that of the M37905M4C-XXXFP except for the following. Therefore, for details except for the following, refer to the datasheet of the M37905M4C-XXXFP.

- Internal ROM: type (flash memory) and size
- RAM size

MEMORY

Figure 1 shows the memory map.

16-BIT CMOS MICROCOMPUTER

FLASH MEMORY MODE

These microcomputers contain the flash memory; and single-powersupply reprogramming is available to this. These microcomputers have the following three modes, enabling reading/programming/erasure for the flash memory:

- Flash memory parallel I/O mode and Flash memory serial I/O mode, where the flash memory is handled by using an external programmer.
- CPU reprogramming mode, where the flash memory is handled by the central processing unit (CPU).

As shown in Figure 4, the flash memory is divided into several blocks, and erasure per block is possible.

This internal flash memory has the boot ROM area storing the reprogramming control software for reprogramming in the CPU reprogramming mode and flash memory serial I/O mode, as well as the user ROM area storing a certain control software for the normal operation in the microcomputer mode.

Although our reprogramming control firmware for the flash memory serial I/O mode has been stored into this boot ROM area on shipment, the user-original reprogramming control software which is more appropriate for the user's system is reprogrammable into this area, instead. Note that the reprogramming for the boot ROM area is enabled only in the flash memory parallel I/O mode.

MITSUBISHI MICROCOMPUTERS

M37905F8CFP, M37905F8CSP

16-BIT CMOS MICROCOMPUTER

Flash Memory Parallel I/O Mode

The flash memory parallel I/O mode is used to manipulate the internal flash memory with a parallel programmer. This parallel programmer uses the software commands listed in Table 1 to do the flash memory manipulations, such as read/programming/erase operations.

Table 1. Software commands (flash memory parallel I/O mode

	Software Command
Read Array	
Read Status Register	
Clear Status Register	
Programming	
Block Erase	
Erase All Block	

Addresses FF9016 to FF9F16 are the reserved area for the parallel programmer. Therefore, when the user uses the flash memory parallel I/O mode, do not program to this area.

User ROM Area and Boot ROM Area

The user ROM area and boot ROM area can be reprogrammed in the flash memory parallel I/O mode.

The programming and block erase operations can be performed only to these areas.

The boot ROM area, 8 Kbytes in size, is assigned to addresses 000016–1FFF16, so that programming and block erase operations can be performed only to this area. (Access to any address out of this area is prohibited).

The erasable block in the boot ROM area is only one block, consisting of 8 Kbytes. The reprogramming control firmware to be used in the flash memory serial I/O mode has been stored to this boot ROM area on our shipment. Therefore, do not reprogram the boot ROM area if the user uses the flash memory serial I/O mode.

Do not program to addresses FF9016 to FF9F16 because this area is the reserved area for the programmer.

Note that, when the boot ROM area is read out from the CPU in the CPU reprogramming mode, described later, its addresses will be shifted to E00016—FFFF16.

Notice: This is not a final specification to change. Notice: This is not a final specific to change. Some parametric limits are subject to change.

MITSUBISHI MICROCOMPUTERS M37905F8CFP, M37905F8CSP

16-BIT CMOS MICROCOMPUTER

Flash Memory Serial I/O Mode

In the flash memory serial I/O mode, addresses, data, and software commands, which are required to read/program/erase the internal flash memory, are serially input and output with a fewer pins and the dedicated serial programmer.

In this mode, being different from the flash memory parallel I/O mode, the CPU controls reprogramming of the flash memory (using the CPU reprogramming mode), serial input of the reprogramming data, etc.

The reprogramming control firmware for the flash memory serial I/O mode has been stored in the boot ROM area on shipment of the product from us. Note that, then, the flash memory serial I/O mode will become unavailable if the boot ROM area has been reprogrammed in the flash memory parallel I/O mode.

Note that, also, this reprogramming control firmware for the flash memory serial I/O mode is subject to change.

Figures 5 and 6 show the pin connections in the flash memory serial $\ensuremath{\mathsf{I/O}}$ mode.

The three pins, SCLK, SDA, and BUSY, are used to input and output serial data.

The SCLK pin is the input pin of external transfer clocks. The SDA pin is the I/O pin of transmit and receive data, and its output acts as the N-channel open-drain output. To the SDA pin, connect an external pullup resistor (about 1 k Ω). The BUSY pin is the output pin of the BUSY flag (CMOS output) and goes "H" during BUSY periods owing to a certain operation, such as transmit, receive, erase, programming, etc.

Transmit and receive data are serially transferred 8 bits at a time. In the flash memory serial I/O mode, only the user ROM area can be reprogrammed; the boot ROM area is not accessible.

Addresses FF9016 to FF9F16 are the reserved area for the serial programmer. Therefore, when the user uses the flash memory serial I/O mode, do not program to this area.

16-BIT CMOS MICROCOMPUTER

CPU Reprogramming Mode

The CPU reprogramming mode is used to perform the operations for the internal flash memory (reading, programming, erasing) under control of the CPU.

In this mode, only the user ROM area can be reprogrammed; the boot ROM area cannot be reprogrammed.

The user-original reprogramming control software for the CPU reprogramming mode can be stored in either the user ROM area or the boot ROM area.

Because the CPU cannot read out the flash memory in the CPU reprogramming mode, the above software must be transferred to the internal RAM in advance to be executed.

Boot Mode

The user-original reprogramming control software for the CPU reprogramming mode must be stored into the user ROM area or the boot ROM area in the flash memory parallel I/O mode in advance. (If this program has been stored into the boot ROM area, the flash memory serial I/O mode will become unavailable).

Note that addresses of the boot ROM area depend on the accessing ways to the boot ROM area, When accessing in the flash memory parallel I/O mode, these addresses will be shifted to 000016 to 1FFF16. On the other hand, when accessing with the CPU, these addresses will be shifted to E00016 to FFFF16.

Reset removal with both of the MD0 and MD1 pins held "L" invokes the normal microcomputer mode, and the CPU operates using the control software stored in the user ROM area. In this case, the boot ROM area is not accessible.

Removing reset with the MD0 pin held "L" and the MD1 pin "H", the CPU starts its operation using the reprogramming control software stored in the boot ROM area. This mode is called the boot mode. The reprogramming control software in the boot ROM area can also reprogram the user ROM area.

After reset removal, be sure not to change the status at pins MD0 and MD1

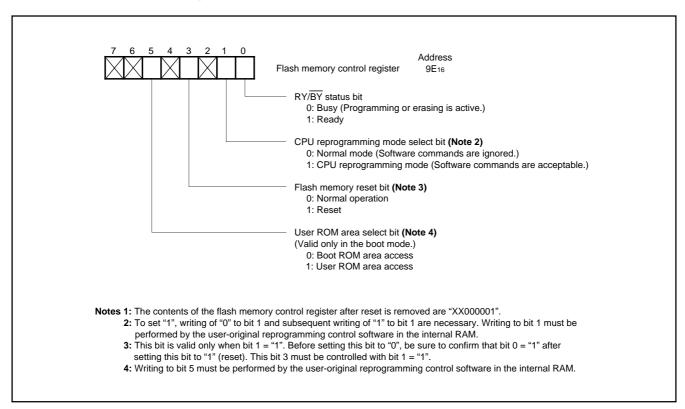

Fig. 7 Bit configuration of flash memory control register

16-BIT CMOS MICROCOMPUTER

Function overview (CPU reprogramming mode)

The CPU reprogramming mode is available in the single-chip mode, memory expansion mode, and boot mode to reprogram the user ROM area only.

In the CPU reprogramming mode, the CPU erases, programs, and reads the internal flash memory by writing software commands. Note that the user-original reprogramming control software must be transferred to the internal RAM in advance to be executed.

The CPU reprogramming mode becomes active when "1" is written into the flash memory control register's bit 1 (the CPU reprogramming mode select bit) shown in Figure 7, and software commands become acceptable.

In the CPU reprogramming mode, software commands and data are all written to and read from even addresses (Note that address Ao in byte addresses = "0".) 16 bits at a time. Therefore, a software command consisting of 8 bits must be written to an even address; therefore, any command written to an odd address will be invalid. Since the write data at the 2nd cycle of a programming command consists of 16 bits, this data must be written to even and odd addresses.

The seaquencer in the flash memory controls the erase and programming operations. What the status of the seaquencer operation is and whether the programming or erase operation has been completed normally or terminated by an error can be examined by reading the flash memory control register.

Figure 7 shows the bit configuration of the flash memory control register.

Bit 0 (the RY/BY status bit) is a read-only bit for indicating the seaquencer operation. This bit goes to "0" (BUSY) while the automatic programming/erase operation is active and goes to "1" (READY) during the other operations.

Bit 1 serves as the CPU reprogramming mode select bit. Writing of "1" to this bit selects the CPU reprogramming mode, and software commands will be acceptable. Because the CPU cannot directly access the internal flash memory in the CPU reprogramming mode, writing to this bit 1 must be performed by the user-original reprogramming control software which has been transferred to the internal RAM in advance. To set bit 1 to "1", it is necessary to write "0" and "1" to this bit 1 successively. On the other hand, to clear this bit to "0", it is sufficient only to write "0".

Bit 3 (the flash memory reset bit) resets the control circuit of the internal flash memory and is used when the CPU reprogramming mode is terminated or when an abnormal access to the flash memory happens. Writing of "1" to bit 3 with the CPU reprogramming mode select bit = "1" preforms the reset operation. To remove the reset, write "0" to bit 3 after confirming bit 0 (the RY/ $\overline{\text{BY}}$ status bit) becomes "1".

Bit 5 serves as the user ROM area select bit and is valid only in the boot mode. Setting this bit to "1" in the boot mode switches an accessible area from the boot ROM area to the user ROM area. To use the CPU reprogramming mode in the boot mode, set this bit to "1". Note that when the microcomputer is booted up in the user ROM area, only the user ROM area is accessible and bit 5 is invalid; on the other hand, when the microcomputer is in the boot mode, bit 5 is valid independent of the CPU reprogramming mode. To rewrite bit 5, execute the user-original reprogramming control software transferred to the internal RAM in advance.

Figure 8 shows the CPU reprogramming mode set/termination flow-

chart, and be sure to follow this flowchart. As shown in Note 1 of Figure 8, before selecting the CPU reprogramming mode, set "0" to the processor mode register 1's bit 7 (the internal ROM bus cycle select bit) and set flag I to "1" to avoid an interrupt request input.

When a watchdog timer interrupt request is generated in the CPU reprogramming mode, when an input to the RESET pin is "L", or when the software reset is performed, the flash memory control circuit and flash memory control register will be reset.

When the flash memory is reset during the erase or programming operation, this operation is cancelled and the target block's data will be invalid. Just before writing a software command related to the erase/programming operation, be sure to write to the watchdog timer. In the CPU reprogramming mode, be sure not to use the **STP** and **WIT** instructions.

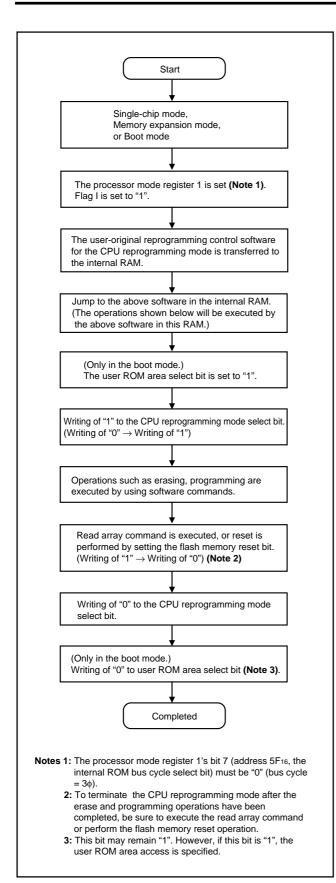

Fig. 8 CPU reprogramming mode set/termination flowchart

Software Commands

Table 2 lists the software commands.

By writing a software command after the CPU reprogramming mode select bit has been set to "1", erasing, programming, etc. can be specified. Note that, at software commands' input, the high-order byte (D8–D15) is ignored. (Except for the write data at the 2nd cycle of a programming command.)

Software commands are explained as below.

Read Array Command (FF16)

By writing command code "FF16" at the 1st bus cycle, the microcomputer enters the read array mode. If an address to be read is input in the next or the following bus cycles, the contents at the specified address are output to the data bus (Do to D15) in a unit of 16 bits.

The read array mode is maintained until writing of another software command.

Read Status Register Command (7016)

Writing command code "7016" at the 1st bus cycle outputs the contents of the status register to the data bus (D0-D7) by a read at the 2nd bus cycle.

The status register is explained later.

Clear Status Register Command (5016)

This command clears two status bits (SR.4, 5) each of which is set to "1" to indicate that the operation has been terminated by an error. To clear these bits, write command code "5016" at the 1st bus cycle.

Programming Command (4016)

This command facilitates programming of 1 word (2 bytes) at a time. To initiate programming, write command code "4016" at the 1st bus cycle; when write data is written in a unit of 16 bits at the 2nd bus cycle, the address is specified at the same time. Upon completion of data writing, automatic programming (data programming and verification) operation is started.

The completion of the automatic programming operation is confirmed by a read of the flash memory control register. The RY/ $\overline{\text{BY}}$ status bit of the flash memory control register goes "0" during the automatic programming operation; and also, it goes "1" after the end of it.

Before execution of the next command, be sure to confirm that the RY/\overline{BY} status bit is set to "1" (READY). During the automatic programming operation, writing of commands and access to the flash memory must not be performed.

When programming continuously, the programming command can be executed with the read status register mode kept if there is no programming error. Simultaneously with start of the automatic programming, the read status register mode is automatically active. In this case, the read status register mode is retained until the next read array command (FF16) is written or until the reset is performed by using the flash memory reset bit.

Reading out the status register after the automatic programming operation is completed reports the result of it. For details, refer to the section on the status register.

Figure 9 shows an example of the programming flowchart.

Additional programming to any word that has already been programmed is prohibited.

Table 2. Software commands (CPU reprogramming mode)

		1st cycle			2nd cycle	
Command	Mode	Address	Data (D ₀ to D ₇)	Mode	Address	Data
Read Array	Write	X (Note 2)	FF16	_	_	_
Read Status Register	Write	Х	7016	Read	Х	SRD (Note 3)
Clear Status Register	Write	Х	5016	_	_	_
Programming	Write	Х	4016	Write	WA (Note 4)	WD (Note 4)
Block Erase	Write	Х	2016	Write	BA (Note 5)	D016
Erase All Block	Write	Х	2016	Write	Х	2016

Notes 1: At software commands' input, the high-order byte of data (D8-D15) is ignored.

- 2: X = An arbitrary address in the user ROM area. (Note that A0 = "0".)
- 3: SRD = Status Register Data
- 4: WA = Write Address, WD = Write Data (16 bits).
- 5: Block address: the maximum address of each block must be input. Note that address A0 = "0".

Block Erase Command (2016/D016)

Writing command code "2016" at the 1st bus cycle and writing confirmation command code "D016" and the maximum address of the block (Note that address A0 = "0".) at the subsequent 2nd bus cycle initiate the automatic erase (erasing and erase verification) operation for the specified block.

The completion of the automatic erase operation is confirmed by a read of the flash memory control register. The RY/ $\overline{\text{BY}}$ status bit of the flash memory control register goes "0" simultaneously with start of the automatic erase operation; and also, it goes "1" simultaneously with completion of it.

Before execution of the next command, be sure to confirm that the RY/\overline{BY} status bit is set to "1" (READY). During the automatic erase operation, writing of commands and access to the flash memory must not be performed.

Simultaneously with start of the automatic erase, the read status register mode is automatically active. In this case, the read status register mode is retained until the next read array command (FF16) is written or until the reset is performed by using the flash memory reset bit.

Reading out the status register after the automatic erase operation is completed reports the result of it. For details, refer to the section on the status register.

Figure 10 shows an example of the block erase flowchart.

16-BIT CMOS MICROCOMPUTER

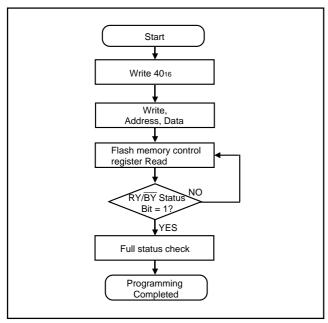

Fig. 9 Programming flowchart

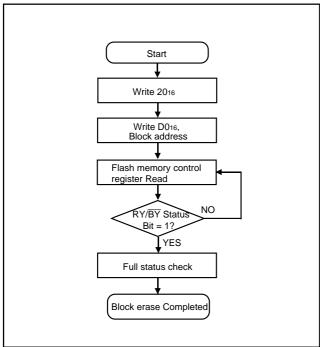

Fig. 10 Block erase flowchart

Erase All Block Command (2016/2016)

Writing command code "2016" at the 1st bus cycle and writing command code "2016" at the subsequent 2nd bus cycle initiate the continuous block erase (chip erase) operations for all the blocks.

The completion of the chip erase operation, as well as of the block erase operation, is confirmed by a read of the flash memory control register. The result of the automatic erase operation is also reported by a read of the status register.

During the automatic erase operation (when the RY/ \overline{BY} status bit = "0"), writing of commands and access to the flash memory must not be performed.

Status Register

The status register is used to indicate whether the programming/ erase operation has been completed normally or terminated by an error. By writing the read status register command (7016), the contents of the status register can be read out; by writing the clear status register command (5016), the contents of the status register can be cleared.

Table 3 lists the definition of each bit of the status register.

The status register outputs "8016" after reset is removed.

The status of each bit is described below.

Notice: This is not a final specification change. Some parametric limits are subject to change.

MITSUBISHI MICROCOMPUTERS M37905F8CFP, M37905F8CSP

16-BIT CMOS MICROCOMPUTER

Erase Status Bit (SR.5)

This bit reports the status of the automatic erase operation. This bit is set to "1" if an erase error occurs and returns to "0" if the clear status register command (5016) is written.

Programming Status Bit (SR.4)

This bit reports the status of the automatic programming operation. This bit is set to "1" if a programming error occurs and returns to "0" if the clear status register command (5016) is written.

Under the condition that any of SR.5, SR.4 = "1", none of the programming, block erase, and erase all block commands can be accepted. Before execution of these commands, execute the clear status register command (5016), in advance, to clear these status bits.

Both of SR.4, SR.5 are set to "1" under the following conditions (Command Sequence Error):

- (1) when data other than "D016" and "FF16" is written to the data in the 2nd bus cycle of the block erase command (2016/D016)
- (2) when data other than "2016" and "FF16" is written to the data in the 2nd bus cycle of the erase all block command (2016/2016)

Note that, writing of "FF16" forces the microcomputer into the read array mode. Simultaneously with this, the command written in the 1st bus cycle will be canceled.

Full Status Check

The full status check reports the results of the erase or programming operation.

Figure 11 shows the full status check flowchart and actions to be taken if an error has occurred.

Table 3. Bit definition of status register

Commando a l	Status	Defir	nition
Symbol	Status	"1"	"0"
SR.7 (D7)	Reserved		
SR.6 (D6)	Reserved		
SR.5 (D ₅)	Erase Status	Terminated by error.	Terminated normally.
SR.4 (D4)	Programming Status	Terminated by error.	Terminated normally.
SR.3 (D3)	Reserved		_
SR.2 (D2)	Reserved		
SR.1 (D1)	Reserved		
SR.0 (D ₀)	Reserved	_

Keep safety first in your circuit designs!

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any
- Intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.

 Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.

 All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.

 The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

- inaccuracies or errors.

 Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (http://www.mitsubishichips.com).

 When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein. Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

 The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.

 If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.

- y diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.

 ase contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein
