

## 20 $\mu$ A, 300 kHz Rail-to-Rail Op Amp

### Features

- Gain Bandwidth Product: 300 kHz (typ.)
- Supply Current:  $I_Q = 20 \mu\text{A}$  (typ.)
- Supply Voltage: 1.8V to 5.5V
- Rail-to-Rail Input/Output
- Extended Temperature Range:  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$
- Available in 5-Pin SC-70 and SOT-23 packages

### Applications

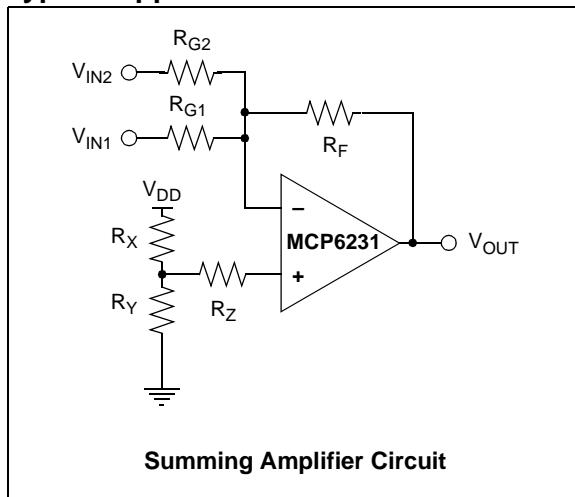

- Automotive
- Portable Equipment
- Transimpedance amplifiers
- Analog Filters
- Notebooks and PDAs
- Battery-Powered Systems

### Available Tools

SPICE Macro Models (at [www.microchip.com](http://www.microchip.com))

FilterLab<sup>®</sup> Software (at [www.microchip.com](http://www.microchip.com))

### Typical Application

### Description

The Microchip Technology Inc. MCP6231/2 operational amplifiers (op amps) provide wide bandwidth for the quiescent current. The MCP6231/2 family has a 300 kHz Gain Bandwidth Product (GBWP) and  $65^\circ$  (typ.) phase margin. This family operates from a single supply voltage as low as 1.8V, while drawing 20  $\mu\text{A}$  (typ.) quiescent current. In addition, the MCP6231/2 family supports rail-to-rail input and output swing, with a common mode input voltage range of  $V_{DD} + 300 \text{ mV}$  to  $V_{SS} - 300 \text{ mV}$ . These op amps are designed in one of Microchip's advanced CMOS processes.

### Package Types

# MCP6231/2

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

$V_{DD} - V_{SS}$ .....	7.0V
All Inputs and Outputs .....	$V_{SS} - 0.3V$ to $V_{DD} + 0.3V$
Difference Input Voltage .....	$ V_{DD} - V_{SS} $
Output Short Circuit Current .....	continuous
Current at Input Pins .....	$\pm 2$ mA
Current at Output and Supply Pins .....	$\pm 30$ mA
Storage Temperature.....	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
Maximum Junction Temperature ( $T_J$ ).....	$+150^{\circ}\text{C}$
ESD Protection On All Pins (HBM;MM) .....	$\geq 4$ kV; 400V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### PIN FUNCTION TABLE

Name	Function
$V_{IN+}$ , $V_{INA+}$ , $V_{INB+}$	Non-inverting Input
$V_{IN-}$ , $V_{INA-}$ , $V_{INB-}$	Inverting Input
$V_{DD}$	Positive Power Supply
$V_{SS}$	Negative Power Supply
$V_{OUT}$ , $V_{OUTA}$ , $V_{OUTB}$	Output

## DC ELECTRICAL SPECIFICATIONS

**Electrical Characteristics:** Unless otherwise indicated,  $T_A = +25^{\circ}\text{C}$ ,  $V_{DD} = +1.8\text{V}$  to  $+5.5\text{V}$ ,  $V_{SS} = \text{GND}$ ,  $V_{CM} = V_{DD}/2$ ,  $R_L = 100$  k $\Omega$  to  $V_{DD}/2$  and  $V_{OUT} \approx V_{DD}/2$ .

Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Input Offset</b>						
Input Offset Voltage	$V_{OS}$	-5.0	—	+5.0	mV	$V_{CM} = V_{SS}$

## 3.0 APPLICATION INFORMATION

The MCP6231/2 family of op amps is manufactured using Microchip's state-of-the-art CMOS process and is specifically designed for low-cost, low-power and general-purpose applications. The low supply voltage, low quiescent current and wide bandwidth makes the MCP6231/2 ideal for battery-powered applications.

### 3.1 Rail-to-Rail Input

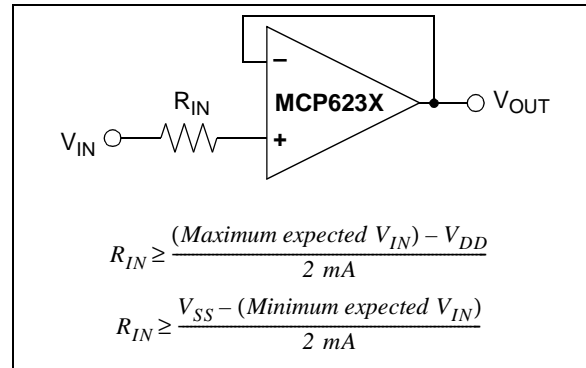

The MCP6231/2 op amps are designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 3-1 shows the input voltage exceeding the supply voltage without any phase reversal.

**FIGURE 3-1:** The MCP6231/2 Show No Phase Reversal.

The input stage of the MCP6231/2 op amps use two differential input stages in parallel. One operates at low common mode input voltage ( $V_{CM}$ ) and the other at high  $V_{CM}$ . With this topology, the device operates with  $V_{CM}$  up to 300 mV above  $V_{DD}$  and 300 mV below  $V_{SS}$ . The input offset voltage is measured at  $V_{CM} = V_{SS} - 300$  mV and  $V_{DD} + 300$  mV to ensure proper operation.

Input voltages that exceed the input voltage range ( $V_{SS} - 0.3$ V to  $V_{DD} + 0.3$ V at 25°C) can cause excessive current to flow into or out of the input pins. Current beyond  $\pm 2$  mA can cause reliability problems. Applications that exceed this rating must be externally limited with a resistor, as shown in Figure 3-2.

**FIGURE 3-2:** Input Current-Limiting Resistor ( $R_{IN}$ ).

### 3.2 Rail-to-Rail Output

The output voltage range of the MCP6231/2 op amps is  $V_{DD} - 35$  mV (min.) and  $V_{SS} + 35$  mV (max.) when  $R_L = 10$  k $\Omega$  is connected to  $V_{DD}/2$  and  $V_{DD} = 5.5$ V. Refer to Figure 2-14 for more information.

### 3.3 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. A unity-gain buffer ( $G = +1$ ) is the most sensitive to capacitive loads, but all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g.,  $> 100$  pF when  $G = +1$ ), a small series resistor at the output ( $R_{ISO}$  in Figure 3-3) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. It does not, however, improve the bandwidth.

**FIGURE 3-3:** Output resistor,  $R_{ISO}$  stabilizes large capacitive loads.

Figure 3-4 gives recommended  $R_{ISO}$  values for different capacitive loads and gains. The x-axis is the normalized load capacitance ( $C_L/G_N$ ), where  $G_N$  is the circuit's noise gain. For non-inverting gains,  $G_N$  and the gain are equal. For inverting gains,  $G_N$  is  $1 + |\text{Gain}|$  (e.g.,  $-1$  V/V gives  $G_N = +2$  V/V).

# MCP6231/2

**FIGURE 3-4:** Recommended  $R_{ISO}$  Values for Capacitive Loads.

After selecting  $R_{ISO}$  for your circuit, double-check the resulting frequency response peaking and step response overshoot. Evaluation on the bench and simulations with the MCP6231/2 SPICE macro model are very helpful. Modify  $R_{ISO}$ 's value until the response is reasonable.

## 3.4 Supply Bypass

With this op amp, the power supply pin ( $V_{DD}$  for single-supply) should have a local bypass capacitor (i.e., 0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$ ) within 2 mm for good high-frequency performance. It also needs a bulk capacitor (i.e., 1  $\mu\text{F}$  or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other parts.

## 3.5 PCB Surface Leakage

In applications where low input bias current is critical, Printed Circuit Board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is  $10^{12}\Omega$ . A 5V difference would cause 5 pA, if current-to-flow. This is greater than the MCP6231/2 family's bias current at 25°C (1 pA, typ).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 3-5.

**FIGURE 3-5:** Example Guard Ring Layout for Inverting Gain.

1. Non-inverting Gain and Unity-Gain Buffer:
  - a. Connect the non-inverting pin ( $V_{IN+}$ ) to the input with a wire that does not touch the PCB surface.
  - b. Connect the guard ring to the inverting input pin ( $V_{IN-}$ ). This biases the guard ring to the common mode input voltage.
2. Inverting and transimpedance gain amplifiers (convert current to voltage, such as photo detectors):
  - a. Connect the guard ring to the non-inverting input pin ( $V_{IN+}$ ). This biases the guard ring to the same reference voltage as the op amp (e.g.,  $V_{DD}/2$  or ground).
  - b. Connect the inverting pin ( $V_{IN-}$ ) to the input with a wire that does not touch the PCB surface.

## 4.0 APPLICATION CIRCUITS

### 4.1 Matching the Impedance at the Inputs

To minimize the effect of input bias current in an amplifier circuit (this is important for very high source-impedance applications, such as pH meters and transimpedance amplifiers), the impedance at both inverting and non-inverting inputs needs to be matched. This is done by choosing the circuit resistor values so that the total resistance at each input is the same. Figure 4-1 shows a summing amplifier circuit.

**FIGURE 4-1:** Summing Amplifier Circuit.

To match the inputs, set all voltage sources to ground and calculate the total resistance at the input nodes. In this summing amplifier circuit, the resistance at the inverting input is calculated by setting  $V_{IN1}$ ,  $V_{IN2}$  and  $V_{OUT}$  to ground. In this case,  $R_{G1}$ ,  $R_{G2}$  and  $R_F$  are in parallel. The total resistance at the inverting input is:

$$R_{VIN^-} = \frac{1}{\left(\frac{1}{R_{G1}} + \frac{1}{R_{G2}} + \frac{1}{R_F}\right)}$$

Where:

$R_{VIN^-}$  = total resistance at the inverting input

At the non-inverting input,  $V_{DD}$  is the only voltage source. When  $V_{DD}$  is set to ground, both  $R_X$  and  $R_Y$  are in parallel. The total resistance at the non-inverting input is:

$$R_{VIN^+} = \frac{1}{\left(\frac{1}{R_X} + \frac{1}{R_Y}\right)} + R_Z$$

Where:

$R_{VIN^+}$  = total resistance at the inverting input

To minimize output offset voltage and increase circuit accuracy, the resistor values need to meet the conditions:

$$R_{VIN^+} = R_{VIN^-}$$

### 4.2 Compensating for the Parasitic Capacitance

In analog circuit design, the PCB parasitic capacitance can compromise the circuit behavior; Figure 4-2 shows a typical scenario. If the input of an amplifier sees parasitic capacitance of several picofarad ( $C_{PARA}$ , which includes the common mode capacitance of 6 pF, typical), and large  $R_F$  and  $R_G$ , the frequency response of the circuit will include a zero. This parasitic zero introduces gain peaking and can cause circuit instability.

**FIGURE 4-2:** Effect of Parasitic Capacitance at the Input.

One solution is to use smaller resistor values to push the zero to a higher frequency. Another solution is to compensate by introducing a pole at the point at which the zero occurs. This can be done by adding  $C_F$  in parallel with the feedback resistor ( $R_F$ ).  $C_F$  needs to be selected so that the ratio  $C_{PARA}:C_F$  is equal to the ratio of  $R_F:R_G$ .

# MCP6231/2

---

## 5.0 DESIGN TOOLS

Microchip provides the basic design tools needed for the MCP6231/2 family of op amps.

### 5.1 SPICE Macro Model

The latest SPICE macro model for the MCP6231/2 op amps is available on our web site at [www.microchip.com](http://www.microchip.com). This model is intended to be an initial design tool that works well in the op amp's linear region of operation at room temperature. See the model file for information on its capabilities.

Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

### 5.2 FilterLab<sup>®</sup> Software

The FilterLab software is an innovative tool that simplifies analog active-filter (using op amps) design. Available free of charge from our web site at [www.microchip.com](http://www.microchip.com), the FilterLab software active-filter design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

## 6.0 PACKAGING INFORMATION

### 6.1 Package Marking Information

5-Lead SC-70 (MCP6231U Only)

Example:

5-Lead SOT-23

Device	Code
MCP6231	BCNN
MCP6231R	BDNN
MCP6231U	BENN

**Note:** Applies to 5-Lead SOT-23.

Example:

8-Lead MSOP

Example:

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

**Legend:** XX...X Customer specific information\*  
 YY Year code (last 2 digits of calendar year)  
 WW Week code (week of January 1 is week '01')  
 NNN Alphanumeric traceability code

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.

\* Standard marking consists of Microchip part number, year code, week code, traceability code (facility code, mask rev#, and assembly code). For marking beyond this, certain price adders apply. Please check with your Microchip Sales Office.

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>X</u>	<u>-X</u>	<u>/XX</u>	<b>Examples:</b>
<b>Device</b>	<b>Tape and Reel and/or Alternate Pinout</b>	<b>Temperature Range</b>	<b>Package</b>	
Device:	MCP6231: Single Op Amp (MSOP, PDIP, SOIC) MCP6231T: Single Op Amp (Tape and Reel) (SOT-23) MCP6231RT: Single Op Amp (Tape and Reel) (SOT-23) MCP6231UT: Single Op Amp (Tape and Reel) (SC-70, SOT-23)			a) MCP6231-E/SN: Extended Temp., 8LD SOIC pkg. b) MCP6231-E/MS: Extended Temp., 8LD MSOP pkg. c) MCP6231-E/P: Extended Temp., 8LD PDIP pkg. d) MCP6231RT-E/OT: Tape and Reel, Extended Temp., 5LD SOT-23 pkg. e) MCP6231UT-E/OT: Tape and Reel, Extended Temp., 5LD SOT-23 pkg. f) MCP6231UT-E/LT: Tape and Reel, Extended Temp., 5LD SC-70 pkg. g) MCP6231T-E/OT: Tape and Reel, Extended Temp., 5LD SOT-23 pkg.
Temperature Range:	E = -40°C to +125°C			a) MCP6232-E/SN: Extended Temp., 8LD SOIC pkg. b) MCP6232-E/MS: Extended Temp., 8LD MSOP pkg. c) MCP6232-E/P: Extended Temp., 8LD PDIP pkg. d) MCP6232T-E/SN: Tape and Reel, Extended Temp., SOIC pkg.
Package:	LT = Plastic Package (SC-70), 5-lead (MCP6231U only) MS = Plastic Micro Small Outline (MSOP), 8-lead P = Plastic DIP (300 mil Body), 8-lead OT = Plastic Small Outline Transistor (SOT-23), 5-lead (MCP6231, MCP6231R, MCP6231U) SN = Plastic SOIC, (150 mil Body), 8-lead			

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.

# MCP6231/2

---

NOTES:

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM  
CERTIFIED BY DNV  
== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
