Features

- Utilizes the *AVR*® Enhanced RISC Architecture
- *AVR* - High Performance and Low Power RISC Architecture
- 118 Powerful Instructions - Most Single Clock Cycle Execution
- 2K bytes of In-System Programmable ISP Flash
  - SPI Serial Interface for In-System Programming
  - Endurance: 1,000 Write/Erase Cycles
- 128 bytes EEPROM
  - Endurance: 100,000 Write/Erase Cycles
- 128 bytes Internal RAM
- 32 x 8 General Purpose Working Registers
  - 3 AT90S/LS2323 Programmable I/O Lines
  - 5 AT90S/LS2343 Programmable I/O Lines
- V_{CC}: 4.0 - 6.0V AT90S2323/AT90S2343
- V_{CC}: 2.7 - 6.0V AT90LS2323/AT90LS2343
- Power-On Reset Circuit
- Speed Grades: 0 - 10 MHz AT90S2323/AT90S2343
- Speed Grades: 0 - 4 MHz AT90LS2323/AT90LS2343
- Up to 10 MIPS Throughput at 10 MHz
- One 8-Bit Timer/Counter with Separate Prescaler
- External and Internal Interrupt Sources
- Programmable Watchdog Timer with On-Chip Oscillator
- Low Power Idle and Power Down Modes
- Programming Lock for Flash Program and EEPROM Data Security
- Selectable On-Chip RC Oscillator
- 8-Pin Device

Description

The AT90S/LS2323 and AT90S/LS2343 is a low-power CMOS 8-bit microcontrollers based on the *AVR*® enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the AT90S/LS2323 and AT90S/LS2343 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

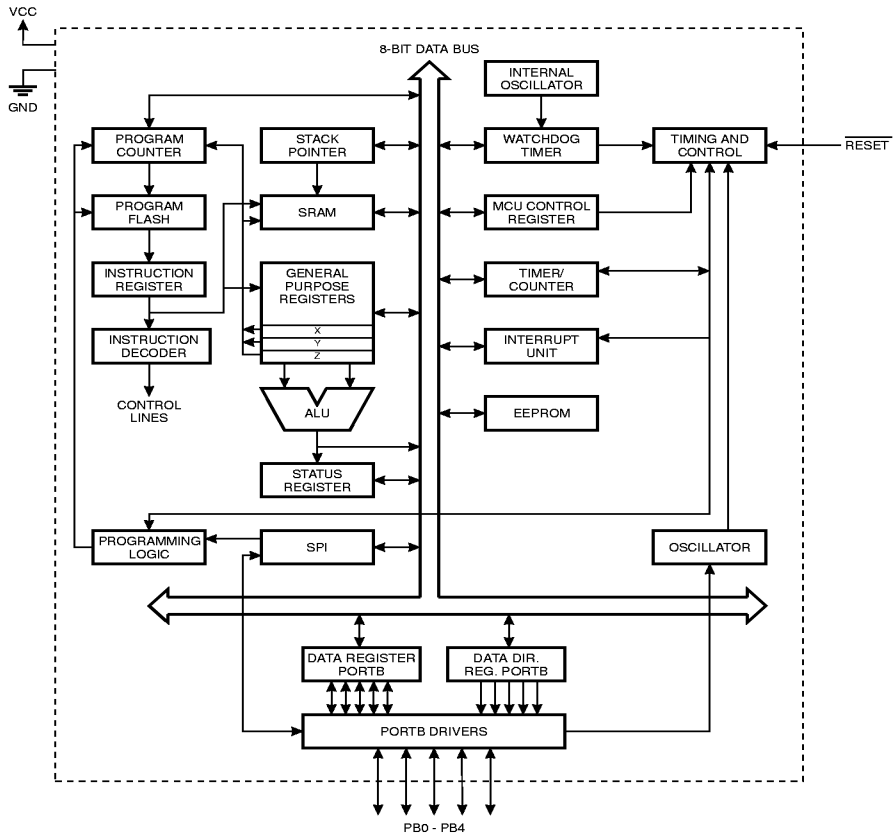

Figure 2. The AT90S/LS2323 Block Diagram

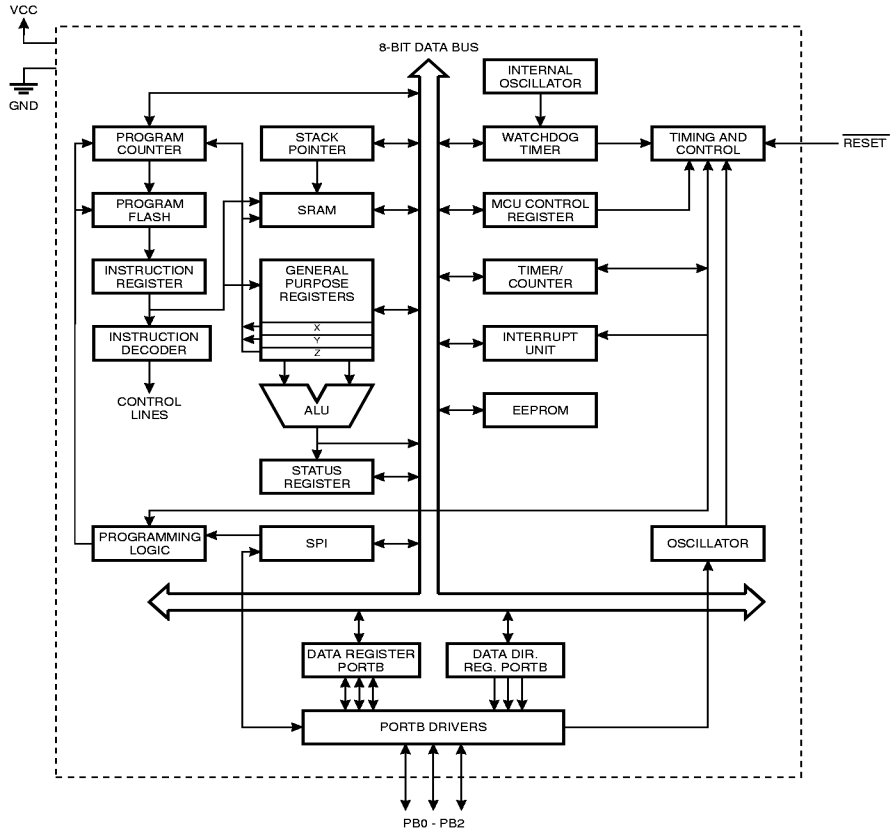

Description

The AT90S/LS2323 and AT90S/LS2343 provides the following features: 2K bytes of In-System Programmable Flash, 128 bytes EEPROM, 128 bytes SRAM, 3 (AT90S/LS2323) / 5 (AT90S/LS2343) general purpose I/O lines, 32 general purpose working registers, an 8-bit timer/counter, internal and external interrupts, programmable Watchdog Timer with internal oscillator, an SPI serial port for Flash Memory downloading and two software selectable power saving modes. The Idle Mode stops the CPU while allowing the SRAM, timer/counters, SPI port and interrupt system to continue functioning. The power down mode saves the register contents but freezes the oscillator, disabling all other chip functions until the next interrupt or hardware reset.

The device is manufactured using Atmel's high density non-volatile memory technology. The on-chip Flash allows the program memory to be reprogrammed in-system through an SPI serial interface. By combining an 8-bit RISC CPU with ISP Flash on a monolithic chip, the Atmel AT90S/LS2323 and AT90S/LS2343 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The AT90S/LS2323 and AT90S/LS2343 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

Comparison Between AT90S/LS2323 and AT90S/LS2343

The AT90S/LS2323 is intended for use with external quartz crystal or ceramic resonator as the clock source. The start-up time is fuse selectable as either 1 ms (suitable for ceramic resonator) or 16 ms (suitable for crystal). The device has three I/0 pins.

The AT90S/LS2343 is intended for use with either an external clock source or the internal RC oscillator as clock source. The device has five I/0 pins.

Table 1 summarizes the differences in features of the two devices.

Table 1. Feature Difference Summary

Part	AT90S/LS2323	AT90S/LS2343
On-chip oscillator amplifier	yes	no
Internal RC Clock	no	yes
PB3 usable	never	internal clock mode
PB4 usable	never	always
Startup time	1 ms / 16 ms	16 µs fixed

Pin Descriptions AT90S/LS2323

VCC

Supply voltage pin.

GND

Ground pin.

Port B (PB2..PB0)

Port B is a 3-bit bi-directional I/O port. Port pins can provide internal pull-up resistors (selected for each bit).

$\overline{\text{RESET}}$

Reset input. A low on this pin for two machine cycles while the oscillator is running resets the device.

XTAL1

Input to the inverting oscillator amplifier and input to the internal clock operating circuit.

XTAL2

Output from the inverting oscillator amplifier.

Pin Descriptions AT90S/LS2343

VCC

Supply voltage pin.

GND

Ground pin.

Port B (PB4..PB0)

Port B is a 5-bit bi-directional I/O port. Port pins can provide internal pull-up resistors (selected for each bit). When the device is clocked from an external clock source, PB3 is used as the clock input.

$\overline{\text{RESET}}$

Reset input. A low on this pin for two machine cycles while the oscillator is running resets the device.

CLOCK

Clock signal input in external clock mode.

Clock Sources

The AT90S/LS2323 contains an inverting amplifier which can be configured for use as an on-chip oscillator, as shown in Figure 3. XTAL1 and XTAL2 are input and output respectively. Either a quartz crystal or a ceramic resonator may be used. It is recommended to use the AT90S/LS2343 if an external clock source is used, since this gives an extra I/O pin.

The AT90S/LS2343 can be clocked by an external clock signal, as shown in Figure 4, or by the on-chip RC oscillator. This RC oscillator runs at a nominal frequency of 1 MHz (VCC = 5V). A fuse bit - RCEN - in the Flash memory selects the on-chip RC oscillator as the clock source when programmed ('0'). The AT90S/LS2343 is shipped with this bit programmed.

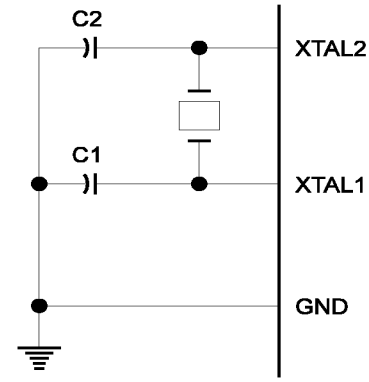

Figure 4. External Clock Drive Configuration

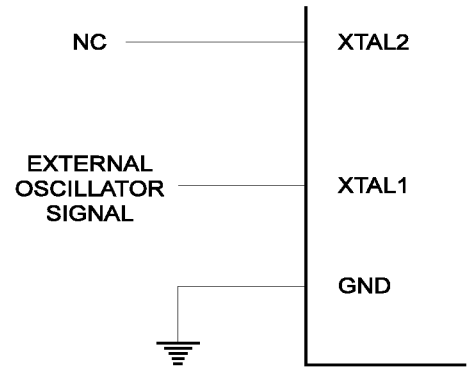

AT90S/LS2323 and AT90S/LS2343 Architectural Overview

The fast-access register file concept contains 32 x 8-bit general purpose working registers with a single clock cycle access time. This means that during one single clock cycle, one ALU (Arithmetic Logic Unit) operation is executed. Two operands are output from the register file, the operation is executed, and the result is stored back in the register file - in one clock cycle.

Six of the 32 registers can be used as three 16-bits indirect address register pointers for Data Space addressing-enabling efficient address calculations. One of the three address pointers is also used as the address pointer for the constant table look up function. These added function registers are the 16-bit X-register, Y-register and Z-register.

The ALU supports arithmetic and logic functions between registers or between a constant and a register. Single register operations are also executed in the ALU. Figure 5 shows the AT90S/LS2323 and AT90S/LS2343 *AVR* Enhanced RISC microcontroller architecture.

In addition to the register operation, the conventional memory addressing modes can be used on the register file as well. This is enabled by the fact that the register file is assigned the 32 lowermost Data Space addresses ($00 - $1F), allowing them to be accessed as though they were ordinary memory locations.

The I/O memory space contains 64 addresses for CPU peripheral functions as Control Registers, Timer/Counters, A/D-converters, and other I/O functions. The I/O memory can be accessed directly, or as the Data Space locations following those of the register file, $20 - $5F.

The *AVR* has Harvard architecture - with separate memories and buses for program and data. The program memory is accessed with a two stage pipeline. While one instruction is being executed, the next instruction is pre-fetched from the program memory. This concept enables instructions to be executed in every clock cycle. The program memory is in-system downloadable Flash memory.

With the relative jump and call instructions, the whole 1K address space is directly accessed. Most *AVR* instructions have a single 16-bit word format. Every program memory address contains a 16- or 32-bit instruction.

During interrupts and subroutine calls, the return address program counter (PC) is stored on the stack. The stack is effectively allocated in the general data SRAM, and consequently the stack size is only limited by the total SRAM size and the usage of the SRAM. All user programs must initialize the SP in the reset routine (before subroutines or interrupts are executed). The 8-bit stack pointer SP is read/write accessible in the I/O space.

The 128 bytes data SRAM + register file and I/O registers can be easily accessed through the five different addressing modes supported in the *AVR* architecture.

The memory spaces in the *AVR* architecture are all linear and regular memory maps.
