64Mb (4Banks) Synchronous DRAM**EM484M1644VTA (4Mx16)****Description**

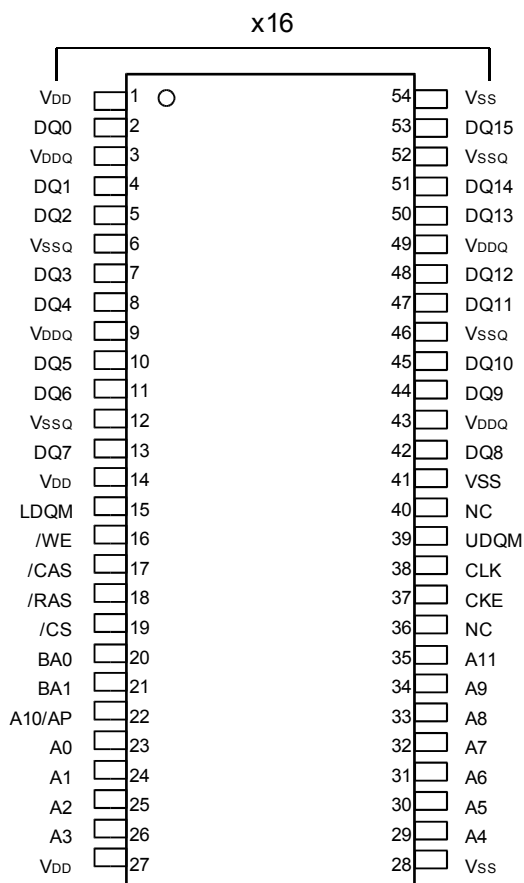

The EM484M1644VTA, is Synchronous Dynamic Random Access Memory (SDRAM) organized as 1,048,576 words x 4 banks x 16 bits. All inputs and outputs are synchronized with the positive edge of the clock. The 64Mb SDRAM uses synchronized pipelined architecture to achieve high speed data transfer rates and is designed to operate at 3.3V low power memory system. It also provides auto refresh with power saving / down mode. All inputs and outputs voltage levels are compatible with LVTTTL .

Feature

- Fully synchronous to positive clock edge
- Single 3.3V +/- 0.3V power supply
- LVTTTL compatible with multiplexed address
- Programmable Burst Length (B/ L) - 1,2,4,8 or full page
- Programmable CAS Latency (C/ L) - 2 or 3
- Data Mask (DQM) for Read / Write masking
- Programmable wrap sequence - Sequential (B/ L = 1/2/4/8/full page)
- Interleave (B/ L = 1/2/4/8)
- Burst read with single-bit write operation
- All inputs are sampled at the rising edge of the system clock.
- Auto refresh and self refresh
- 4,096 refresh cycles / 64ms

Pin Descriptions (Simplified)

Pin	Name	Pin Function
CLK	System Clock	Master Clock Input(Active on the Positive rising edge)
/CS	Chip select	Selects chip when active
CKE	Clock Enable	Activates the CLK when "H" and deactivates when "L". CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby.
A0 ~ A11	Address	Row address (A0 to A11) is determined by A0 to A11 level at the bank active command cycle CLK rising edge. CA(CA0 to CA7) is determined by A0 to A7 level at the read or write command cycle CLK rising edge. And this column address becomes burst access start address. A10 defines the pre-charge mode. When A10 = High at the pre-charge command cycle, all banks are pre-charged. But when A10 = Low at the pre-charge command cycle, only the bank that is selected by BA0/BA1 is pre-charged.
BA0, BA1	Bank Address	Selects which bank is to be active.
/RAS	Row address strobe	Latches Row Addresses on the positive rising edge of the CLK with /RAS "L". Enables row access & pre-charge.
/CAS	Column address strobe	Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
/WE	Write Enable	Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
UDQM /LDQM	Data input/output Mask	DQM controls I/O buffers.
DQ0 ~ 15	Data input/output	DQ pins have the same function as I/O pins on a conventional DRAM.
VDD/VSS	Power supply/Ground	VDD and VSS are power supply pins for internal circuits.
VDDQ/VSSQ	Power supply/Ground	VDDQ and VSSQ are power supply pins for the output buffers.
NC	No connection	This pin is recommended to be left No Connection on the device.

- Notes**
- All entries assume that CKE was active (High level) during the preceding clock cycle.
 - If all banks are idle, and CKE is inactive (Low level), SDRAM will enter Power down mode.
All input buffers except CKE will be disabled.
 - Illegal to bank in specified states;
→ Function may be legal in the bank indicated by Bank Address (BA), depending on the state of that bank.
 - If all banks are idle, and CKE is inactive (Low level), SDRAM will enter Self refresh mode.
All input buffers except CKE will be disabled.
 - Illegal if trCD is not satisfied.
 - Illegal if trAS is not satisfied.
 - Must satisfy burst interrupt condition.
 - Must satisfy bus contention, bus turn around, and/or write recovery requirements.
 - Must mask preceding data which don't satisfy tDPL.
 - Illegal if trRD is not satisfied.

Transition Time of Input Signals	2ns
Input Reference Level	1.4V

Operating AC Characteristics

($V_{DD} = 3.3V \pm 0.3V$, $T_a = 0 \sim 70^\circ C$, $T_a = -40 \sim 85^\circ C$ for 6I/7I)

Parameter		Symbol	-55		-6/6I		-7/7L/7I		Units	Notes

Data-out to high impedance from PRECHARGE command	CL = 3	t _{ROH}	3		3		3		CLK	
	CL = 2						2		CLK	
Refresh time(4,096 cycle)		t _{REF}		64		64		64	ms	

* All voltages referenced to V_{SS}.

Note :

1. t_{HZ} defines the time at which the output achieve the open circuit condition and is not referenced to output voltage levels.
2. These parameters account for the number of clock cycles and depend on the operating frequency of the clock, as follows :
The number of clock cycles = Specified value of timing/clock period
(Count fractions as a whole number)
