75XL SERIES

4-BIT SINGLE-CHIP MICROCONTROLLER

Selection Guide, Version 3

75XL

The μ PD754144, 754244, and 754264 are manufactured and sold under a license contact with CP8 Transac corporation with respect to patents on on-chip EEPROM microprocessors. The μ PD754144, 754244, and 754264 cannot be used in IC cards (SMART CARDS).

EEPROM is a trademark of NEC Corporation.

MS-DOS and Windows are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

IBM DOS, PC/AT, and PC DOS are trademarks of International Business Machines Corporation.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

The application circuits and their parameters are for references only and are not intended for use in actual design-in's.

The information in this document is based on documents issued in June, 1996 at the latest. The information is subject to change without notice. For actual design-in, refer to the latest publications of data sheet, etc., for the most up-to-date specifications of the device.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.

PREFACE

Since 1973 when NEC developed μ COM-4, Japan's first 4-bit single-chip microcontroller, NEC has continued to be an industry pioneer by marketing original, higher performance products. We have produced the μ COM-43 Series, μ PD7500 Series, and 75X Series. Of these, the 75X Series has product groups covering about 60 products. Moreover, product development and preparation responded to the demands of customers from a variety of fields.

The 75XL Series was marketed as a 4-bit single-chip microcontroller for the future capable of inheriting the software assets used previously by the customers, and as an upward compatible CPU core.

The 75XL Series is a 4-bit microcontroller achieving high speed operation at low voltages and operation functions rivaling those of 8-bit microcontrollers.

This document introduces the features, product line, and development tools of the 75XL Series.

Note Under development

2. 75XL SERIES FEATURES

(1) High-speed operation at low voltages

The CPU core of the 75XL Series can operate in the wide power-supply voltage range of $V_{DD} = 1.8$ to 5.5 V. One instruction execution times are fast as shown below.

- 0.95 μs ($V_{DD} = 1.8$ V, @ 4.19 MHz operation)
- 0.67 μs ($V_{DD} = 2.7$ V, @ 6.0 MHz operation)

(2) Maintaining software compatibility with 75X Series

The 75X Series had three CPU cores, one each for low end, standard, and high end use. Porting software between these CPUs demanded attention be given to the instruction set supported by each CPU. In the 75XL Series, however, the high end CPU core in the 75X Series became the only CPU core. Therefore, compatibility with the array of 75X Series software developed previously is maintained in the 75XL Series.

(3) Systematization of memory having outstanding cost/performance

The ROM capacity can be selected based on the program size.

(4) Dual clock operation

Two oscillators are provided on the chip for the main system clock (max. 6.0 MHz) capable of high-speed operation similar to a portion of 75X Series products and the subsystem clock (32.768 kHz) for low-power consumption operation. Therefore, the system clock can be switched by the program to match the use. (However, this is limited to products with the subsystem clock.)

2.1 Hardware Features

<1> Program memory

Program memory can be expanded to a maximum of $64K \times 8$ bits. In addition, table data can be referenced using the table lookup instruction (MOVT).

<2> Data memory

Data memory can be expanded to a maximum of 16 banks, where one bank is 256×4 bits. As with program memory, this is planned in designing the Series. The data memory space is allocated into the following 5 regions.

- a. Static RAM
- b. General purpose registers
- c. Stack area
- d. I/O ports
- e. Peripheral hardware (timers, SIO, interrupts, etc.)

<3> General-purpose registers

General-purpose registers in the 75XL can be configured on chip into a maximum of 4 banks from the eight 4-bit registers of X, A, B, C, D, E, H, and L. They are mapped into the data memory and can be operated by general-purpose register manipulation instructions and data memory manipulation instructions.

XA, BC, DE, and HL form register pairs and can be manipulated as 8-bit data. In addition to the DE and HL register pairs, a DL register pair can also be formed. These three groups can be used as data pointers.

The optimum number of register banks are configured on chip in each product.

<4> High-speed operation and low-power consumption

In the 75XL Series, an instruction cycle of $0.67 \mu s$ can be achieved as the fastest processing speed. Since an instruction cycle can be changed by program control, applications like switching during low-speed operation when the power-supply voltage drops become possible.

The two standby modes are HALT and STOP. Intermittent operation becomes possible because CPU operation is stopped by either mode in a program and can be resumed by an interrupt signal.

In products with an on-chip subsystem clock, intermittent operation is also possible in the low-power consumption mode.

<5> Interrupt functions

The interrupt vector table in the 75XL Series can specify a maximum of 7 interrupts. Each one can have two interrupt sources. Thus, a maximum of 14 interrupt sources can be installed. The optimum interrupt sources are configured in each product.

In models loaded with multiple on-chip register banks, a function is provided to automatically switch register banks during vectored interrupt operations. Register save and return do not have to be performed in an interrupt processing routine.

In the 75XL Series, the number of interrupt sources and the responsiveness to interrupts are improved.

<6> Expandability of on-chip peripheral hardware

By adopting memory-mapped I/O in the 75XL Series, the CPU and the peripheral hardware are independent. Therefore, peripheral hardware having a variety of functions can be installed only when needed.

2.2 Software Features

<1> Addressing modes and accumulators

Since peripheral hardware is mapped to the data memory space in the 75XL Series, instruction descriptions center on general-purpose registers and data memory. General-purpose registers can be specified in 4-bit units or 8-bit units as described earlier. In contrast, data memory can be addressed in 1-bit, 4-bit, or 8-bit units.

As for accumulators, where data processing is concentrated, three types each of the CY flag (bit accumulator), the A register (4-bit accumulator), and the XA (8-bit accumulator) are provided for each bit lengths. Therefore, the program can be freely described to match the bit length of the processed data.

<2> Instruction set features

a. 8-bit processing instructions

Transfers, comparisons, operations, incrementing, and decrementing are the available 8-bit instructions in the 75XL Series. The data processing can rival that of 8-bit microcontroller.

b. 1-bit processing instructions

In the 75XL Series, a bit address is directly specified and can be set, cleared, and tested. Therefore, programs are easy to understand and can be concisely described. In addition, by using the carry flag as a bit accumulator, the Boolean operations of AND, OR, and XOR can be performed between specified bits. As a result, concise descriptions are possible in accordance with logic even in complex decision processing. Simultaneously, the load on the program is lessened and program execution becomes efficient.

c. GETI instruction

The GETI instruction in the 75XL Series pre-defines any 2-byte or 3-byte instruction in a table and then executes them by reading a 1-byte GETI instruction. A total of 48 instructions can be defined. If this GETI instruction is effectively used, the program size can be dramatically decreased.

3. 75XL SERIES PRODUCT DEVELOPMENT

- General-purpose series (μ PD7500xx)
- General-purpose series with on-chip RC oscillation circuit (μ PD7501xx)
- General-purpose series with on-chip A/D converter (μ PD75006x)
- LCD driver series(μ PD7530xx, 7530xxA)
- LCD driver series with on-chip A/D converter (μ PD75303x)
- LCD driver series (small-size) (μ PD7531xx)
- LCD driver series (small-size) (μ PD7532xx)
- Keyless entry series (μ PD7541xx, 7542xx)
- General-purpose small-size series (μ PD7543xx)

Note Under development

5.1 General-Purpose Series (μ PD7500xx)

Applicable products: μ PD750004, 750006, 750008, 75P0016, 750004(A), 750006(A), 750008(A)

This subseries consists of microcontrollers possessing a high level of generality and equipped with I/O ports, serial interfaces, watch timers, interrupt functions, watch subsystem clock generators. These products extend CPU functions beyond the conventional μ PD75008 subseries (75X Series product) and are capable of high-speed operation at the low voltage of 2.2 V. Not only does this microcontroller replace conventional products, it is optimal for battery-operated applications and can be used as the standard microcontroller in all fields.

The μ PD750004(A), 750006(A), and 750008(A) are "special" quality grades for the μ PD750004, 750006, and 750008, respectively.

[Features]

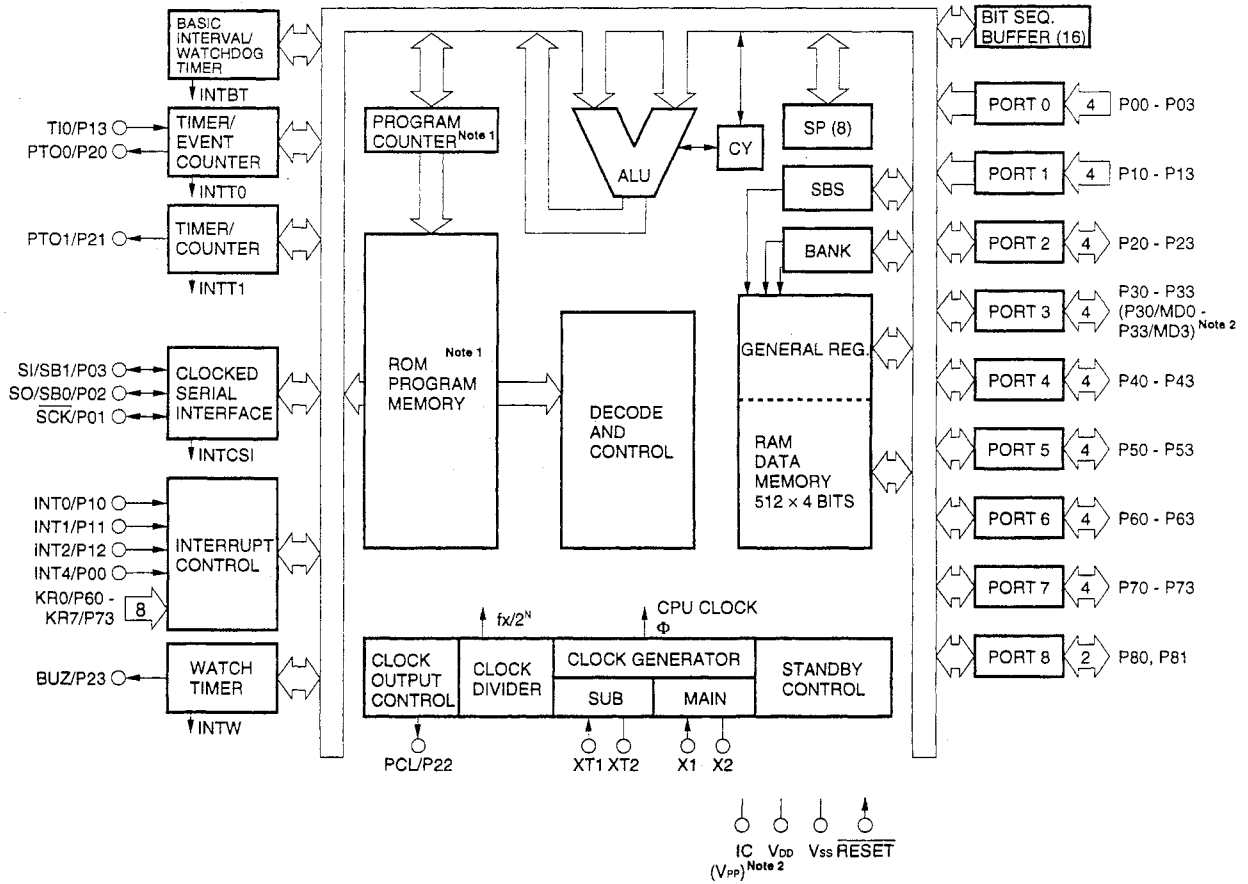

- Low voltage, high-speed operation possible: $0.85 \mu\text{s}$ ($V_{DD} = 2.2 \text{ V}$, @ 4.19 MHz)
 $0.67 \mu\text{s}$ ($V_{DD} = 2.7 \text{ V}$, @ 6.0 MHz)
- Enhanced timer function: 4 channels
 - Basic interval timer usable as a watchdog timer
- Can have on-chip pull-up resistors in the 33 I/O lines
 - Medium voltage, N-channel open-drain I/O ports: 8
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional μ PD75008 subseries are inherited
- PROM version available
 - μ PD75P0016 (one-time PROM)

[Applications]

Standard : VCRs, CD players, cordless telephones, radios, cameras, home electric appliances, etc.

Special : Car electrics

Block Diagram

Notes 1. Differs with the model.

5.2 General-Purpose Series with RC Oscillator (μ PD7501xx)

Applicable products: μ PD750104, 750106, 750108, 75P0116, 750104(A), 750106(A), 750108(A)

This subseries incorporates input/output ports, serial interface, watch timer, interrupt functions, and watch subsystem clock oscillation circuit, in addition an RC oscillation circuit as a main system clock oscillation circuit. It has extended CPU functions with respect to the conventional μ PD75008 subseries, that is, products of the 75X Series. In addition, a high-speed operation in 1.8V of low voltage is allowed. Therefore it is ideal for the applications using a battery as well as the replacement of the previous products, and it can be used as a standard microcontroller in every field.

The μ PD750104(A), 750106(A), and 750108(A) are "special" quality grades for the μ PD750104, 750106, and 750108, respectively.

[Features]

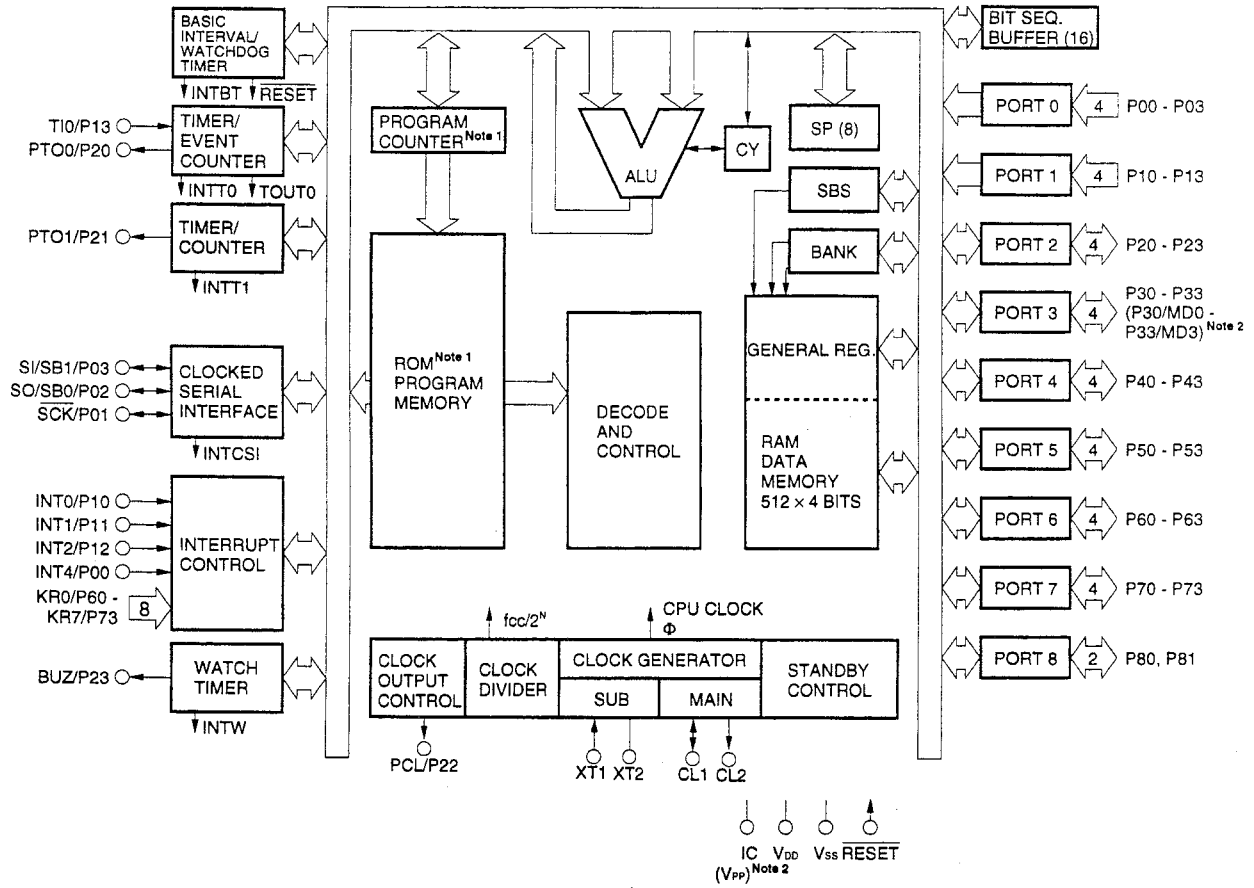

- Low-voltage, high-speed operation possible: $4 \mu\text{s}$ ($V_{\text{DD}} = 1.8\text{V}$, @ 1 MHz)
 $2 \mu\text{s}$ ($V_{\text{DD}} = 1.8\text{V}$, @ 2 MHz)
- On-chip RC oscillation circuit as a main system clock oscillation circuit
 - A processing starts immediately after the standby mode releases
- Enhanced function: 4 channels
 - Basic interval timer usable as a watchdog timer
- On-chip pull-up resistors in the 33 I/O lines enable
 - Medium voltage, N-channel open-drain I/O ports: 8
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, and multiple interrupts.
- Easy replacement due to the inherited functions and instructions of the conventional μ PD75008 and 750008 subseries.
- PROM version available
 - μ PD75P0116 (one-time PROM)

[Applications]

Standard : VCRs, CD players, cordless telephones, radios, cameras, home electric appliances, etc.

Special : Car electrics

Package		<ul style="list-style-type: none"> • 42-pin plastic shrink DIP (600mil) • 44-pin plastic QFP (10 \times 10 mm) 			

5.3 General-Purpose Series with On-Chip A/D Converter (μ PD75006 \times)

Applicable products: μ PD750064, 750066, 750068, 75P0076, 750064(A), 750066(A), 750068(A)

This subseries incorporates not only input/output ports, serial interface, watch timer, interrupt functions, watch subsystem clock oscillation circuit, but also an A/D converter with low-voltage operation capability. It has extended CPU functions with respect to the μ PD75068 subseries, that is, the previous 75X series products, allowing you to create more efficient programs. In addition, use of a small 42-pin package allows for high-speed, low-voltage (1.8 V) operation. It is therefore ideal for sets using batteries as well as mechanisms-control applications.

The μ PD750064(A), 750066(A), and 750068(A) are "special" quality grades for the μ PD750064, 750066, and 750068, respectively.

[Features]

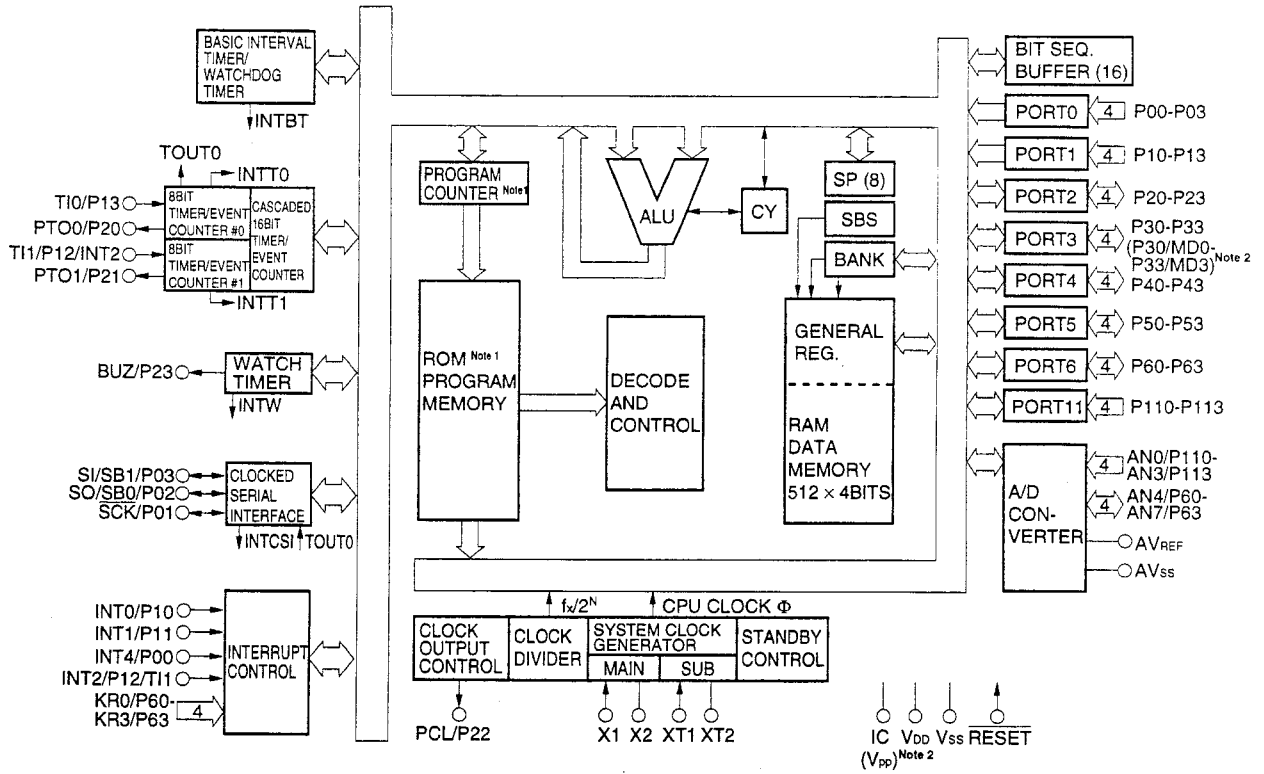

- Low-voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- On-chip A/D converter with low-voltage operation possible ($V_{DD} = 1.8$ to 5.5 V)
 - 8-bit resolution \times 8 channels (absolute accuracy ± 1.5 LSB)
- Enhanced timer function: 4 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Use of small SOP package facilitates wiring.
- Replacement is easy because the functions and instructions of the conventional μ PD75068 subseries are inherited
- PROM version available
 - μ PD75P0076 (one-time PROM)

[Applications]

Standard: Cordless telephones, AV equipment, home electric appliances, OA equipment, health equipment, meters, gas tables, etc.

Special: Car electrics

5.4 LCD Drive Series (μ PD7530xx, 7530xxA)

Applicable products: μ PD753012, 753016, 753017, 75P3018, 753012A, 753016A, 753017A, 75P3018A

This subseries has an on-chip LCD panel controller/driver and is suitable for equipment using LCD panels. Not only does it inherit functions and instructions of the μ PD75308 subseries, that is a product of the conventional 75X Series, it can be used as a 16-bit timer/event counter by using 2 channels of the 8-bit timer/event counter, and expands the functions like generating a carrier frequency for remote controllers.

The μ PD753012A, 753016A, 753017A, and 75P3018A are low voltage versions for the μ PD753012, 753016, 753017, and 75P3018, respectively.

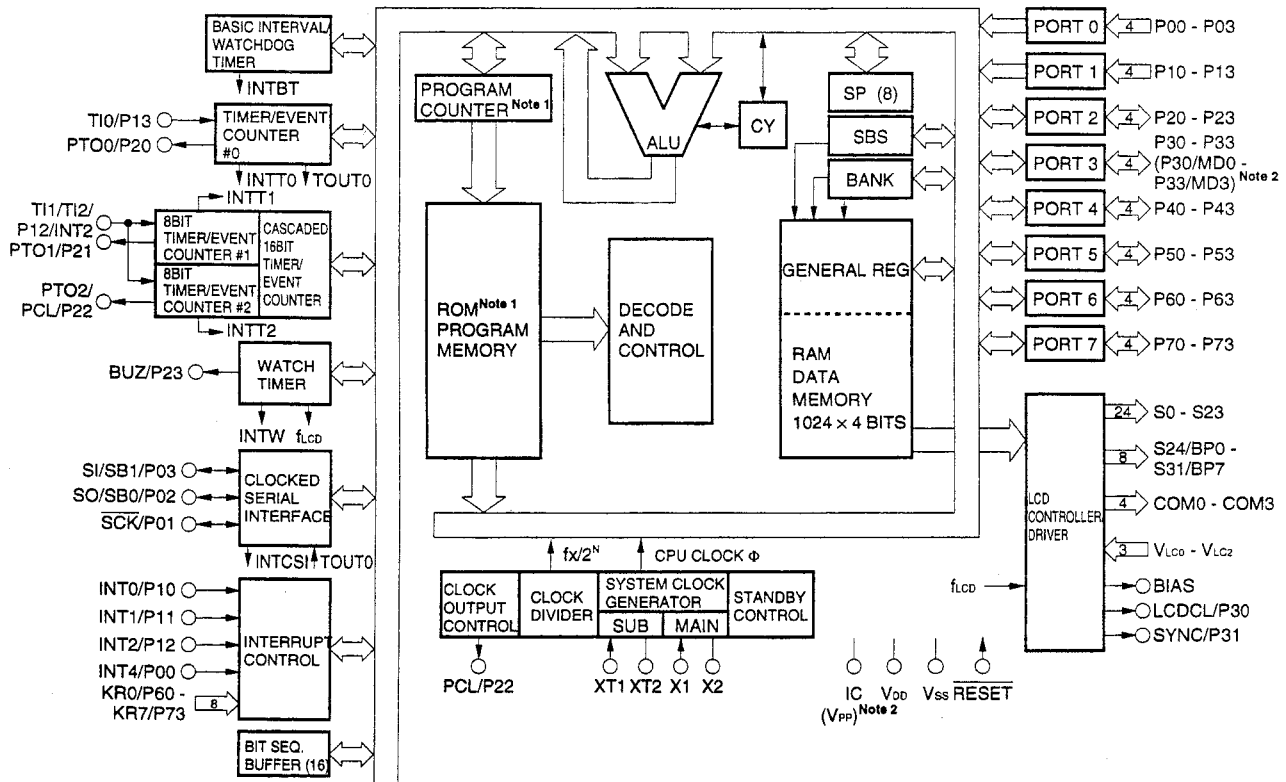

[Features]

- Low voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- On-chip programmable LCD controller/driver
 - LCD panel can have a maximum of 128 segments
- Enhanced timer function: 5 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- Can have on-chip pull-up resistors in the 31 I/O lines
 - Medium voltage, N-channel, open-drain I/O ports: 8
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional μ PD75308 subseries are inherited
- PROM version available
 - μ PD75P3018 and 75P3018A (one-time PROM)

[Applications]

Camcorders, CD players, telephones, cameras, pagers, remote controllers, etc.

5.5 LCD Drive Series with On-Chip A/D Converter (μ PD75303 \times)

Applicable products: μ PD753036, 75P3036

This subseries consists of the μ PD753017 subseries containing an on-chip LCD panel controller/driver with an additional on-chip A/D converter capable of low voltage operation. Not only does it inherit the functions and instructions of the μ PD75336 subseries, the previous 75X series products, but it also provides two 8-bit timer/event counter channels, allowing it to be used as a 16-bit timer/event counter, with extended functions such as generation of remote control carrier frequency. Its low-voltage (1.8 V), high-speed operation widens the range of applicable applications.

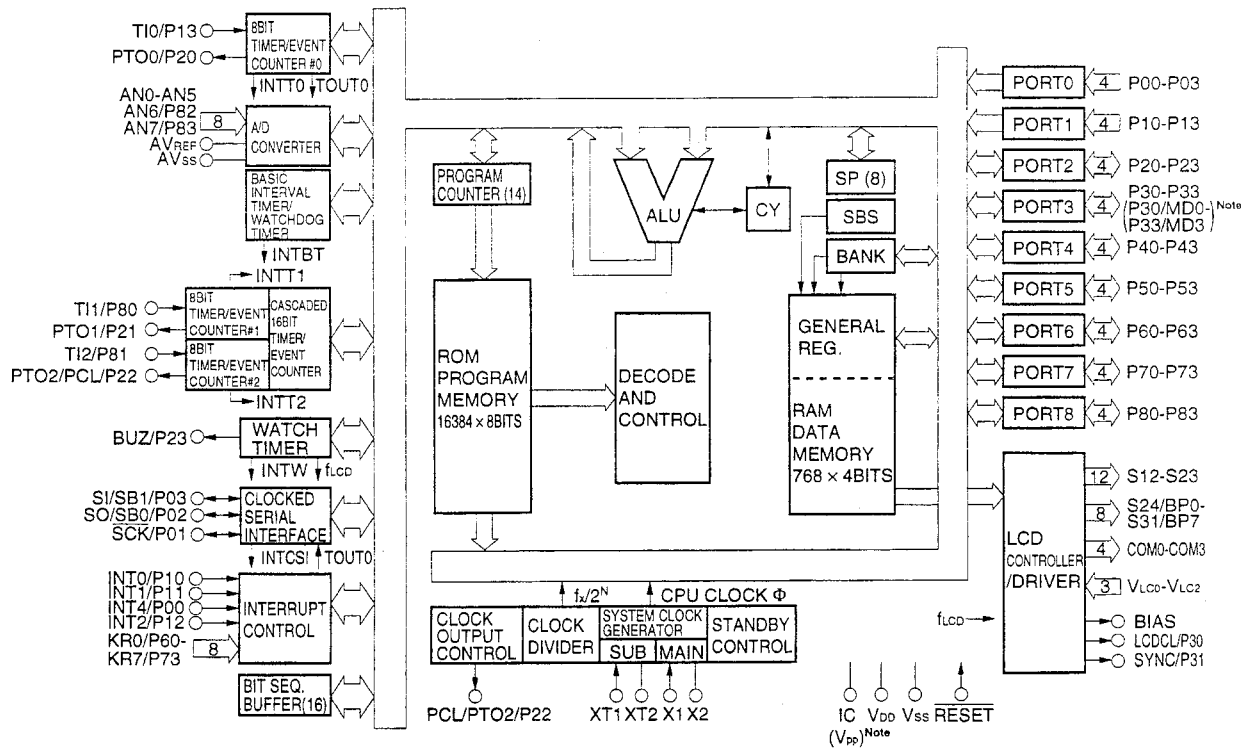

[Features]

- Low-voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- On-chip programmable LCD controller/driver
 - LCD panel can have a maximum of 128 segments
- On-chip A/D converter with low-voltage operation possible ($V_{DD} = 1.8$ to 5.5 V)
 - 8-bit resolution \times 8 channels (absolute accuracy 1.5 LSB)
- Enhanced timer function: 5 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
 - Long-time timer setting is possible
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional μ PD75336 subseries are inherited
- PROM version available
 - μ PD75P3036 (one-time PROM)

[Applications]

Cordless telephones, AV equipment, home electric appliances, OA equipment, health equipment, meters, gas tables, etc.

5.6 LCD Drive Series (Small-size) (μ PD7531xx)

Applicable products: μ PD753104, 753106, 753108, 75P3116

This subseries has an on-chip LCD panel controller/driver and is suitable for equipment using LCD panels. This has a 64-pin package and is a small-size version of the μ PD753017 subseries. Not only does it inherit functions and instructions of the μ PD75308 subseries, that is a product of the conventional 75X Series, it can be used as a 16-bit timer/event counter by using 2 channels of the 8-bit timer/event counter, and expands the functions like generating a carrier frequency for remote controllers.

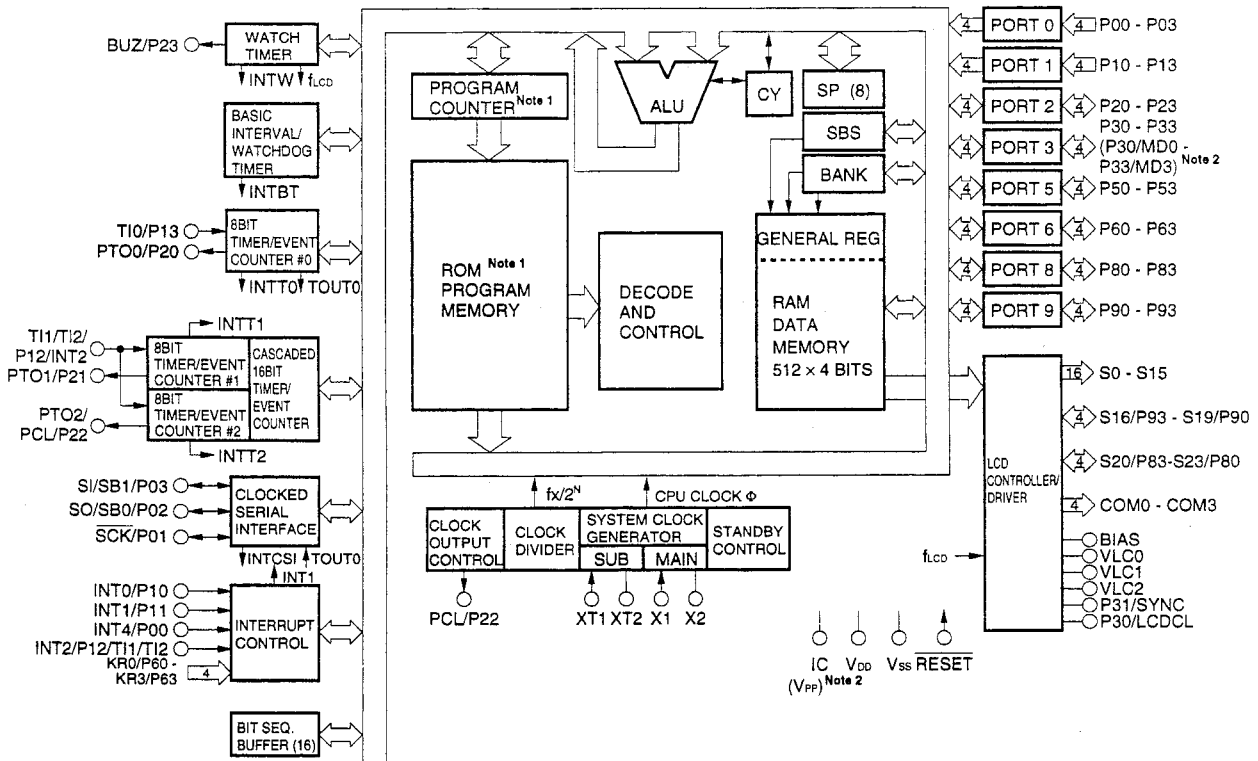

[Features]

- Low voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- On-chip programmable LCD controller/driver
 - LCD panel can have a maximum of 96 segments
- Enhanced timer function: 5 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- Can have on-chip pull-up resistors in the 31 I/O lines
 - Medium voltage, N-channel, open-drain I/O ports: 4
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional μ PD75308 subseries are inherited
- PROM version available
 - μ PD75P3116 (one-time PROM)

[Applications]

Telephones, cameras, sphygmomanometers, gas meters, electronic scales, remote controllers, etc.

Power-supply voltage	$V_{DD} = 1.8$ to 5.5 V			
Package	<ul style="list-style-type: none"> • 64-pin plastic QFP (14 \times 14 mm) • 64-pin plastic TQFP (12 \times 12 mm) 			

5.7 LCD Drive Series (Small-Size) (μ PD7532xx)

Applicable products: μ PD753204, 753206, 753208, 75P3216

This subseries is a small-size version of the μ PD753108 subseries with reduced on-chip LCD panel controller/driver and without the subsystem clock. It uses in common the same CPU functions and instructions as those used in the 75XL series. Furthermore, the small 48-pin package and low-voltage (1.8 V), high-speed operation capability make it suitable for small set applications using batteries.

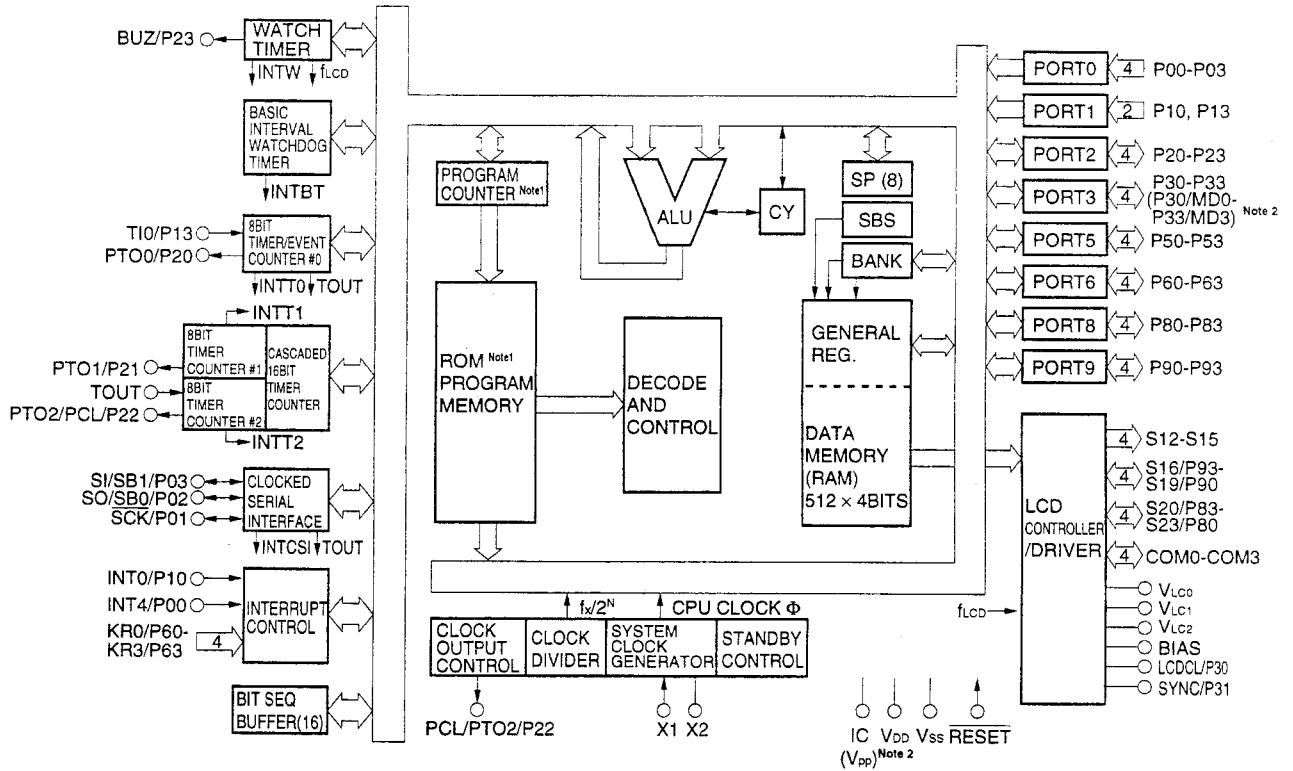

[Features]

- Low-voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- Enhanced timer function: 5 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional μ PD75308 subseries are inherited
- PROM version available.
 - μ PD75P3216 (one-time PROM)

[Applications]

Remote control, cameras, sphygmomanometers, CD radio cassette players, gas meters, etc.

Block Diagram

Notes 1. Differs with the model.

2. Data in the parentheses are for μ PD75P3216.

[Function List]

Item	μ PD753204	μ PD753206	μ PD753208	μ PD75P3216
ROM (bytes)	4096 (mask ROM)	6144 (mask ROM)	8192 (mask ROM)	16384 (one-time PROM)
RAM (\times 4 bits)	512			
General-purpose registers	(4 bits \times 8) \times 4 banks or (8 bits \times 4) \times 4 banks			
Instruction execution time	<ul style="list-style-type: none"> • 0.95, 1.91, 3.81, 15.3 μs (main system clock: 4.19 MHz) • 0.67, 1.33, 2.67, 10.7 μs (main system clock: 6.0 MHz) 			
I/O ports	CMOS inputs	6	Connection of on-chip pull-up resistors can be specified by software: 5	
	CMOS I/O	20	Can directly drive LEDs Connection of on-chip pull-up resistors can be specified by software Shared segment pins: 8	
	N-channel open-drain I/O	4	Can directly drive LEDs Pull-up resistors can be made on chip with mask option	No pull-up resistor
	Total	30		
LCD controller/driver	<ul style="list-style-type: none"> • Selectable segment numbers : 4/8/12 segments (Can switch in CMOS input/output port in units of 4, maximum of 8) • Selectable display modes : Static, 1/2 duty (1/2 bias), 1/3 duty (1/2 bias), 1/3 duty (1/3 bias), 1/4 duty (1/3 bias) 			
	Split resistors for LCD drive can be made on chip with mask option			No split resistor for LCD drive
Timer	5 channels <ul style="list-style-type: none"> • 8-bit timer/event counter: 1 channel • 8-bit timer/counter: 2 channels (usable as 16-bit timer counter) • Basic interval timer/watchdog timer: 1 channel • Watch timer: 1 channel 			
Serial interface	3 selectable modes <ul style="list-style-type: none"> • 3-wire serial I/O mode ... Switching between MSB first and LSB first • 2-wire serial I/O mode • SBI mode 			
Vectored interrupt	External: 2; Internal: 5			
Test input	External: 1; Internal: 1			
Clock output (PCL)	<ul style="list-style-type: none"> • Φ, 524, 262, 65.5 kHz (system clock: 4.19 MHz) • Φ, 750, 375, 93.7 kHz (system clock: 6.0 MHz) 			
Buzzer output (BUZ)	<ul style="list-style-type: none"> • 2, 4, 32 kHz (system clock: 4.19 MHz) • 2.86, 5.72, 45.8 kHz (system clock: 6.0 MHz) 			
Power-supply voltage	$V_{DD} = 1.8$ to 5.5 V			
Package	• 48-pin plastic shrink SOP (375 mil, 0.65 mm pitch)			

5.8 Keyless Entry Series (μ PD7541xx,7542xx)

Applicable products: μ PD754144, 754244, 754264 ^{Note} (On-chip EEPROM version), μ PD754202

Note Under development

This subseries consists of microcontrollers that incorporate stand-by release function by the key input, as well as EEPROM in data memory (except μ PD754202). Also an on-chip carrier generator that can easily output infrared remote control waveforms allows it to be used as a data carrier. It uses in common the same CPU and instructions as those used for the 75XL series. Furthermore, the small 20-pin package and low-voltage (1.8 V), high-speed operation capability make it suitable for small set applications using batteries.

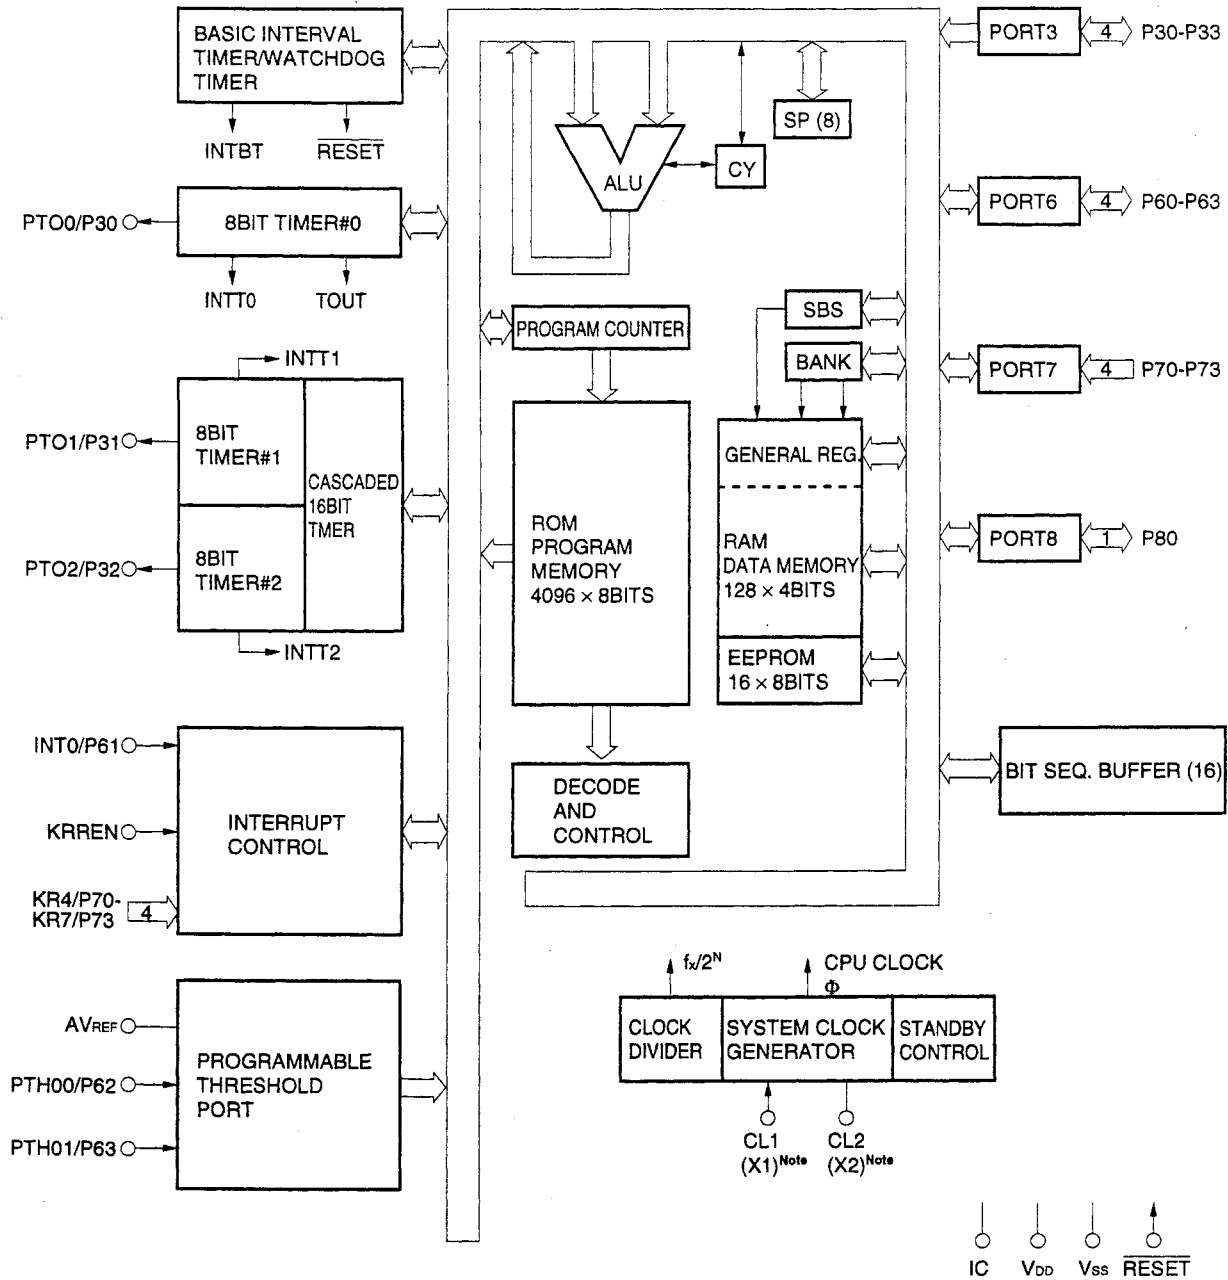

[Features]

- Low-voltage, high-speed operation possible:
 - μ PD754144: 4 μ s ($V_{DD} = 1.8$ V, @ 1 MHz)
 - μ PD754244, 754264, 754202 : 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- On-chip EEPROM capable of retaining data even in event of power failure (data memory area) (except μ PD754202)
 - μ PD754144, 754244: 16 bytes
 - μ PD754264: 32 bytes
- Enhanced timer function: 4 channels
 - Usable as a 16-bit timer counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional 75XL series are inherited

[Applications]

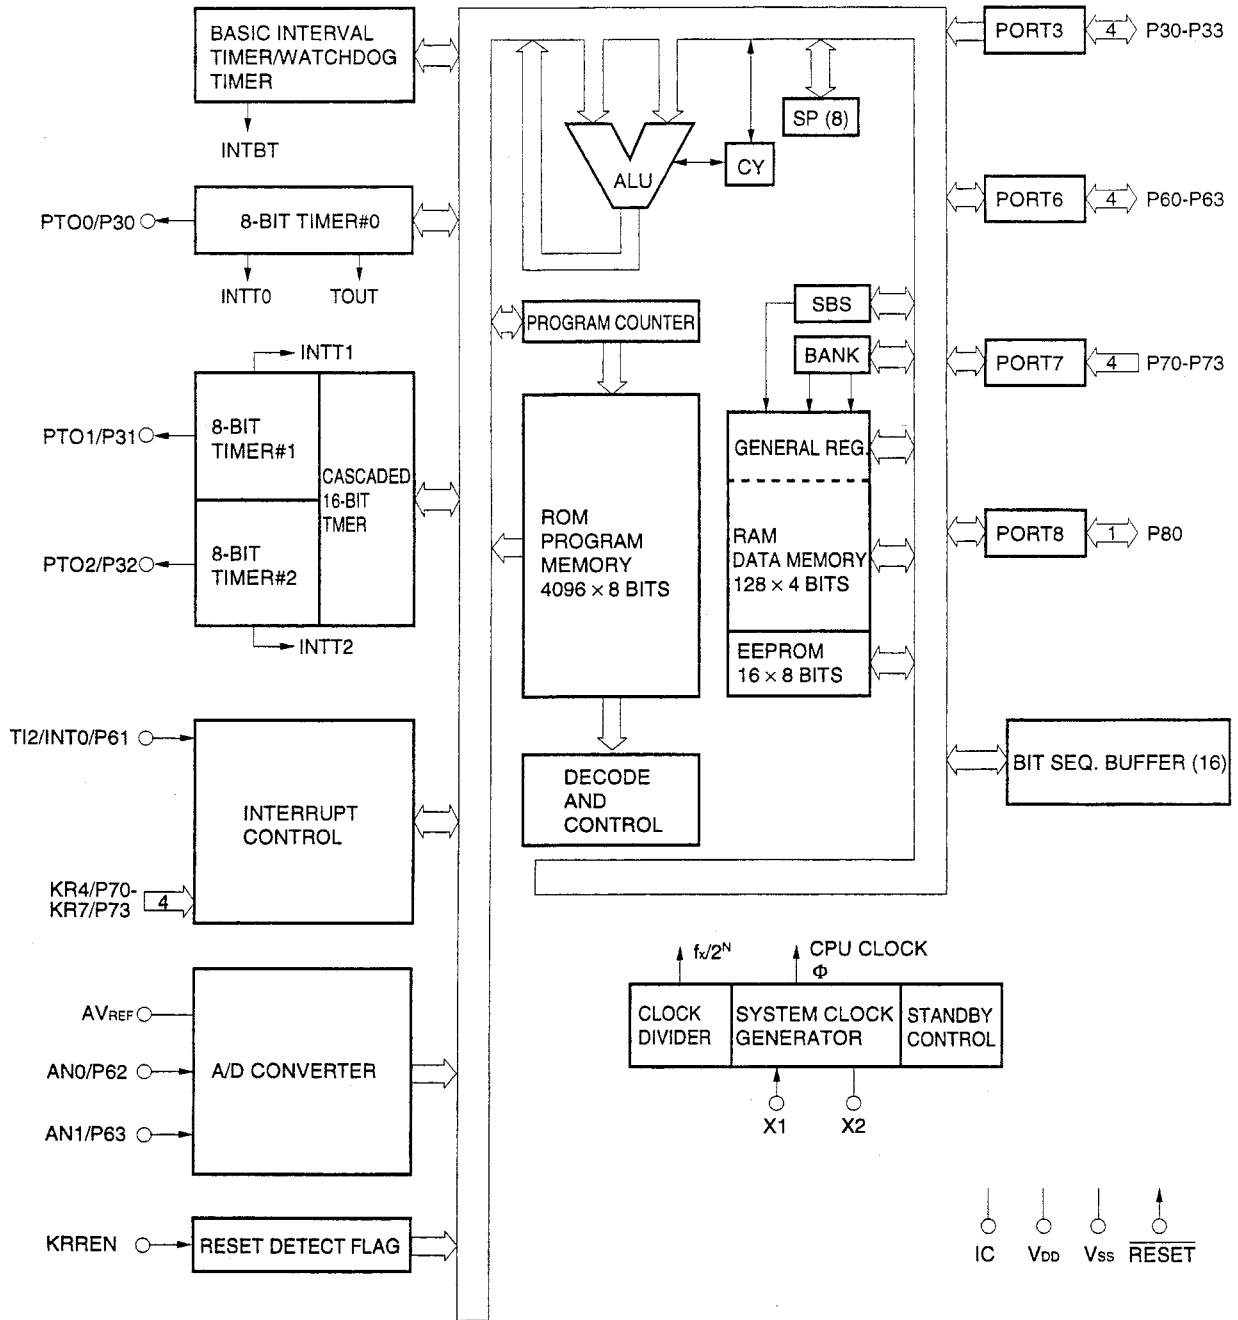

Keyless entries, data carriers

5.9 General-Purpose Small-Size Series (μ PD7543xx)

Applicable products: μ PD754302, 754304, 75P4308, 754302(A), 754304(A)

This subseries consists of general-purpose small-size microcontrollers with on-chip general-purpose input/output ports as well as serial bus interface. It not only inherits the functions and instructions of the previous 75X series products, but also has extended functions such as incorporation of 3 timer channels. Furthermore, the small 36-pin package and low-voltage (1.8 V), high-speed operation capability make it suitable for small set applications using a submicrocontroller and batteries.

The μ PD754302(A) and 754304(A) are "special" quality grades for the μ PD754302 and 754304, respectively.

[Features]

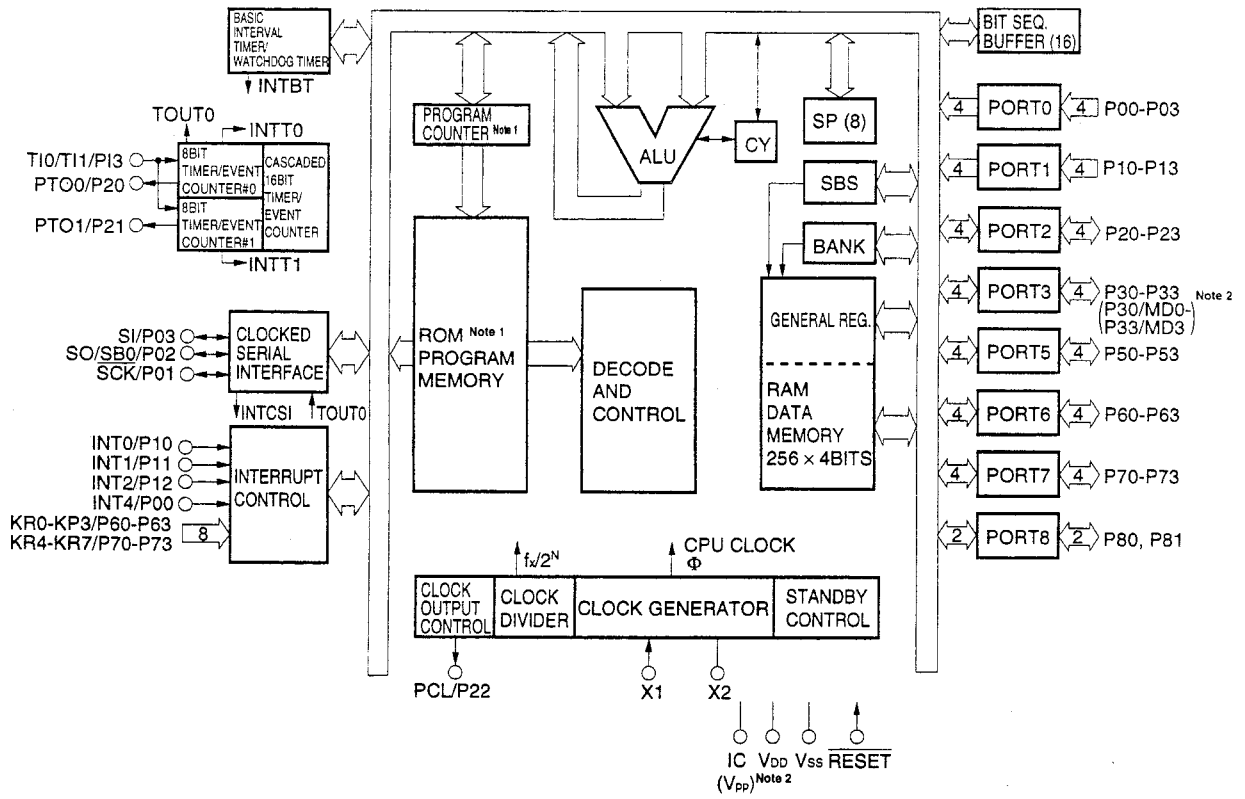

- Low-voltage, high-speed operation possible: 0.95 μ s ($V_{DD} = 1.8$ V, @ 4.19 MHz)
0.67 μ s ($V_{DD} = 2.7$ V, @ 6.0 MHz)
- Enhanced timer function: 3 channels
 - Usable as a 16-bit timer/event counter
 - On-chip remote control carrier frequency generator
 - Basic interval timer usable as a watchdog timer
- On-chip serial interface allows it to be used as a submicrocontroller for various kinds of application equipment
- Enhanced interrupt functions such as standby release by key input, interrupt at termination of serial data transfer, multiple interrupts, etc.
- Replacement is easy because the functions and instructions of the conventional 75XL series are inherited
- PROM version available
 - μ PD75P4308 (one-time PROM)

[Applications]

Standard: Cordless telephones, TVs, VCRs, audio equipment, home electric appliances, OA equipment, etc.

Special: Car electronics

6. 75XL SERIES INSTRUCTION SET

The 75XL Series instruction set combines the top level models of the 75X Series that is the predecessor of the 75XL Series. Consequently, upward compatibility is maintained in the 75XL Series with the array of 75X Series software developed previously.

The features of the 75XL Series instruction set are presented next.

- (1) Bit manipulation instructions capable of a variety of applications
- (2) 4-bit manipulation instructions with excellent efficiency
- (3) 8-bit manipulation instructions rivaling those in an 8-bit microcontroller
- (4) GETI instruction to reduce the program size
- (5) String effect instructions and decimal adjust instructions to improve program efficiency
- (6) Table lookup instructions suited to continuous references
- (7) One-byte branch relative instructions
- (8) NEC standard mnemonics organized for easy understanding

The operand column of each instruction is described as shown in the table below (For details, see the **RA75X ASSEMBLER PACKAGE USER'S MANUAL - Language (EEU-1343)**).

- When there are multiple description methods, select one.

Example reg in the operand column means one of the registers from X to L. Therefore, specify one register from registers X to L.

- Write uppercase letters, and the + and – symbols as shown.
- For immediate data, use numerics.
- Definition as a symbol is possible.

Table 6-1. Operand Description Method

Representation format	Description method
reg	X, A, B, C, D, E, H, L
reg1	X, B, C, D, E, H, L
rp	XA, BC, DE, HL
rp1	BC, DE, HL
rp2	BC, DE
rp'	XA, BC, DE, HL, XA', BC', DE', HL'
rp'1	BC, DE, HL, XA', BC', DE', HL'
rpa	HL, HL+, HL–, DE, DL
rpa1	DE, DL
n4	4-bit immediate data or label
n8	8-bit immediate data or label
mem	8-bit immediate data or label ^{Note 1}
bit	2-bit immediate data or label
fmem	FB0H - FBFH, FF0H - FFFH immediate data or label
pmem	FC0H - FFFH immediate data or label
addr ^{Note 2}	0000H - 3FFFH immediate data or label
addr1 ^{Note 2}	0000H - 7FFFH immediate data or label (MK II mode only)
caddr	12-bit immediate data or label
faddr	11-bit immediate data or label
taddr	20H - 7FH immediate data (where bit0 = 0) or label
PORTn ^{Note 3}	PORT0 - PORT11
IExxx ^{Note 3}	IEBT, IET0 - IET2, IE0 - IE2, IE4, IECS1, IEW, IEED
RBn ^{Note 2}	RB0 - RB3
MBn ^{Note 2}	MB0 - MB4, MB15

- Notes**
1. mem can only use an even address in 8-bit processing.
 2. The ranges of addr, addr1, RBn, and MBn differ with the product.
 3. The number of PORTn and IExxx differs with the product.

			<ul style="list-style-type: none"> When instruction is not TBR or TCALL (taddr) (taddr + 1) instruction is executed			

- Notes**
1. When the IN or OUT instruction is executed, MBE must be set to 0 or 1 and MBS must be set to 15.
 2. The operations in the shaded boxes only apply in the MkII mode. The others can apply only in the MkI mode.
 3. The TBR and TCALL instructions are the table definition assembler pseudo instructions of the GETI instruction.

7. 75XL SERIES APPLICATION EXAMPLES

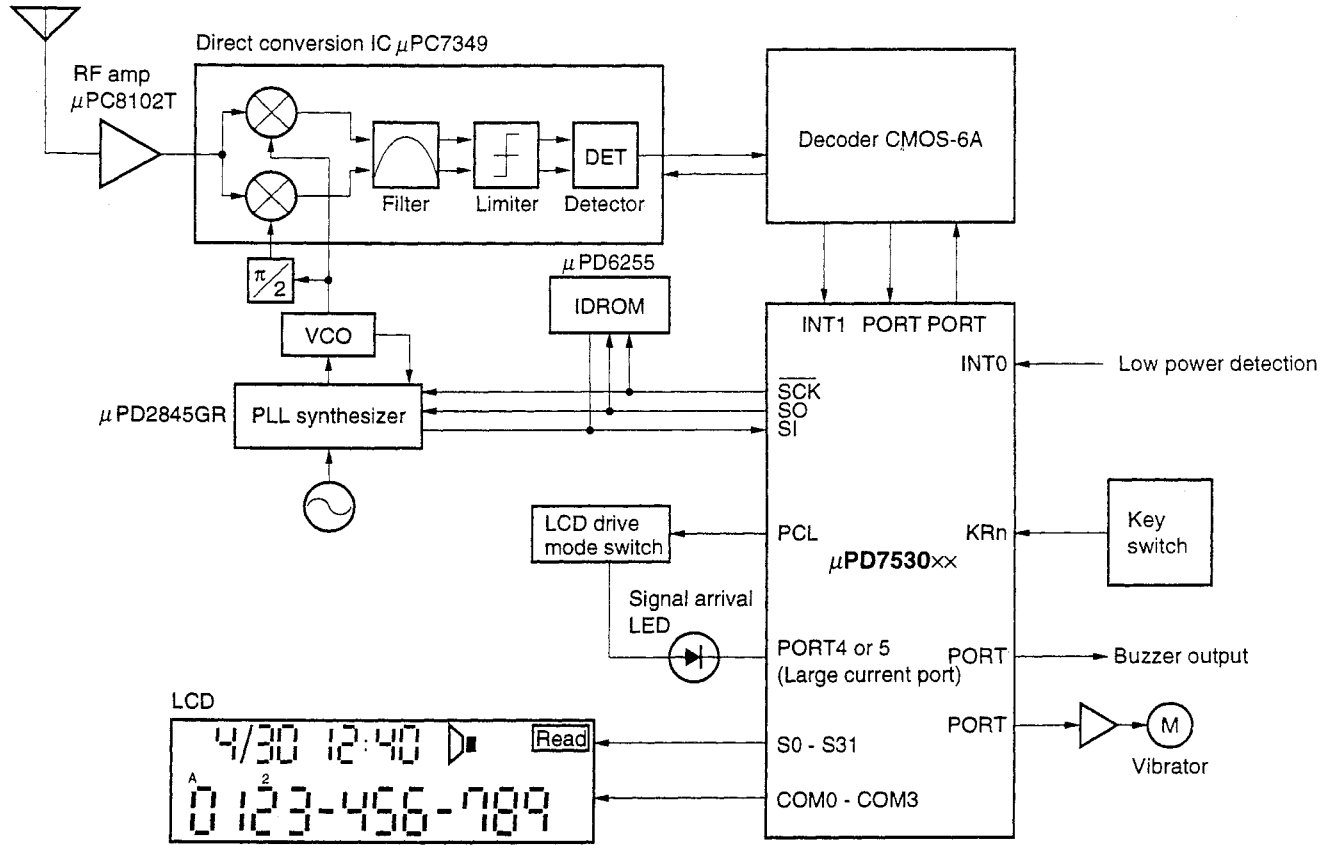

Compact disk player (low end model)

Touchtone telephone (telephone)

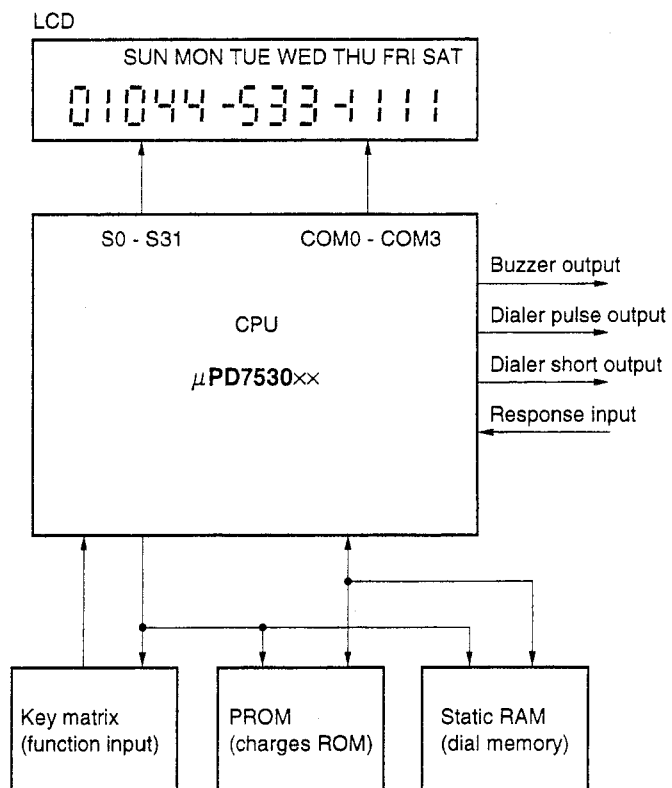

Pager receiver (numerical display model)

Remote control

Auto dialer

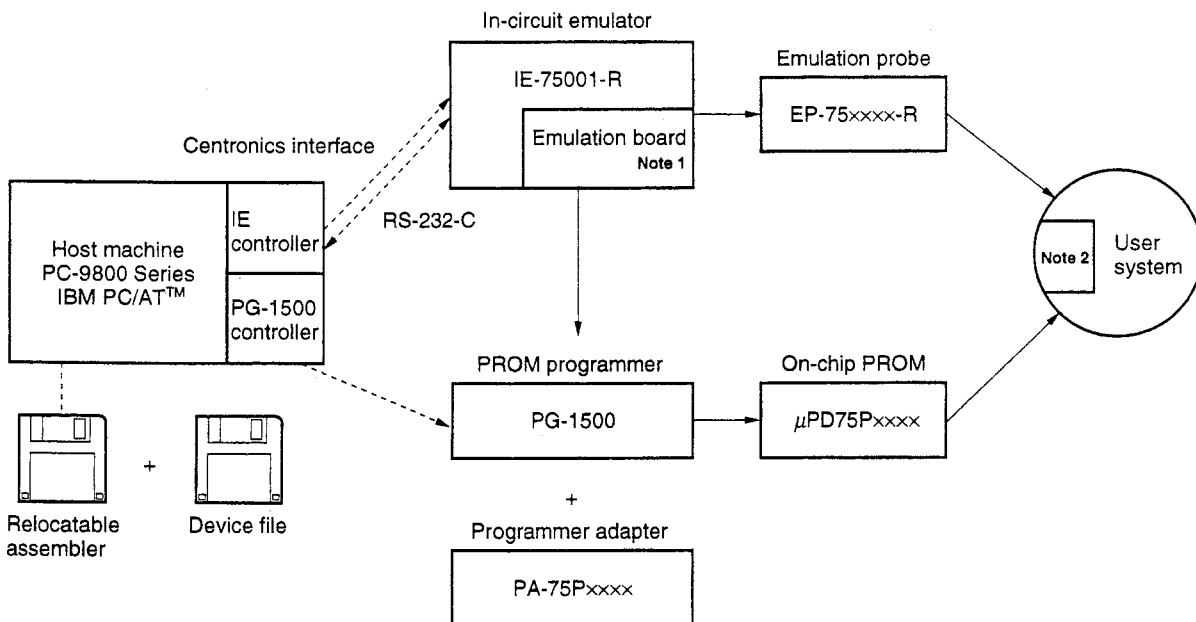

8. 75XL SERIES DEVELOPMENT TOOLS

The following development tools are prepared for program development for the 75XL Series.

- Debugging tools
- Language processor
- PROM writing tools

Figure 8-1 shows the configuration of the development tools.

Figure 8-1. Development Tools Configuration

Notes 1. IE-75001-R does not have an on-chip emulation board. IE-75300-R-EM (option) is required.

2. A conversion socket (product names beginning with EV-9200), or a conversion adapter or flexible board (product names beginning with EV-950) for connecting the emulation probe to the user system.

Remark xxxx: The product name differs with the target device and package.

8.1 Debugging Tools

The following tool is prepared as program debugging tool in the 75XL Series.

- In-circuit emulator: IE-75001-R

8.1.1 In-circuit emulator

The IE-75001-R is used as the in-circuit emulator.

IE-75001-R does not have an on-chip emulation board. When the IE-75001-R is used, the IE-75300-R-EM, which is an option, is required.

Hardware	IE-75001-R	When an application system using the 75XL Series is developed, IE-75001-R is the in-circuit emulator for debugging the hardware and software. When developing the 75XL Series, the IE-75001-R, the emulation board (option), and the emulation probe are used together. The host machine and PROM programmer are connected and debugging can be effectively performed.			
	IE-75300-R-EM	An emulation board for evaluating the application system using the 75XL Series, used in combination with the IE-75001-R.			
	EP-75xxxx-R	An emulation probe for the 75XL Series. It is connected to IE-75001-R and IE-75300-R-EM.			
Software	IE control program	IE-75001-R and the host machine are connected with the RS-232-C and Centronics interface. The IE-75001-R is controlled by the host machine.			
		Host machine	OS	Supply media	Part No. (product name)
		PC-9800 Series	MS-DOS™ (Ver. 3.30 to Ver. 6.2 Note)	3.5-inch, 2HD	μS5A13IE75X
				5-inch, 2HD	μS5A10IE75X
		IBM PC/AT and compatible machines	See 8.4.	3.5-inch, 2HC	μS7B13IE75X
5-inch, 2HC	μS7B10IE75X				

Note Although there is a task swap function in Ver. 5.0 or later, the task swap function cannot be used in this software.

- Remarks**
1. xxxx: The product name differs with the target device and package.
 2. IE control program operation is guaranteed only for the operating systems and host machines described above.

[Features]

- Real-time emulation possible at 6 MHz
- Memory capacity
 - Program memory: 64K bytes
 - Data memory: 4K nibbles
- Trace display possible during execution
- Wealth of break functions
 - Sequential break, parallel break, break by guard external signal
- Check trace, qualify trace, section trace
- Coverage function
- High-speed download function using a parallel interface
- On-line assembler, reverse assembler function
- Symbolic debugging function
- Data memory, internal register real-time output

IE-75001-R

IE-75300-R-EM

8.1.2 Development tool list

The development tools for each target device are listed below.

(1/5)

Item \ Series	General-purpose series μ PD7500xx		General-purpose series with on-chip oscillation circuit μ PD7501xx		General-purpose series with on-chip A/D converter μ PD75006x

8.2 Language Processor

RA75X relocatable assembler	This is a relocatable assembler for efficient 75XL Series program development.			
	Host machine	OS	Supply media	Part No. (product name)
	PC-9800 Series	MS-DOS (Ver. 3.30 to Ver. 6.2 Note)	3.5-inch, 2HD	μS5A13RA75X
			5-inch, 2HD	μS5A10RA75X
	IBM PC/AT and compatible machines	See 8.4.	3.5-inch, 2HC	μS7B13RA75X
5-inch, 2HC			μS7B10RA75X	

Note Although there is a task swap function in Ver. 5.00 or later, the task swap function cannot be used in this software.

Remark Operation of relocatable assembler is guaranteed only for the operating systems and host machines described above.

- RA75X relocatable assembler

In the 75XL Series, the relocatable assembler common to the series is combined and used with the device file of each product. By using the relocatable assembler, the program is divided into the modules for each function and developed. Programs having common elements can be used as a library. Thus, development efficiency can be substantially improved. By using a structured assembler attached to the RA75X, C like structured programming becomes possible.

[Features]

- Optimization function for branch instructions
- Useful pseudo instructions
 - Vector table definition pseudo instructions
 - Table definition pseudo instructions for GETI instruction
- Relocation attributes of CSEG pseudo instruction
- Wealth of application utilities (attached to RA75X)
 - Structured assembler (ST75X)
 - Macro processor (MP)
 - Librarian (LB75X)
 - List converter (LCNV75X)

- Device file list

μPD754304	
μPD75P4308	

Remark The operation of the device files is guaranteed only for the operating systems and host machines that correspond to the relocatable assembler.

8.3 PROM Writing Tools

8.3.1 PROM programmer

Hardware	PG-1500	A PROM programmer that can program a single-chip microcontroller with an on-chip PROM as stand alone or with the manipulation from a host machine by connecting the attached board and optional programmer adapter.			
	PA-75Pxxxx	A PROM programmer adapter for the 75XL Series used by connecting a PG-1500.			
Software	PG-1500 controller	The PG-1500 and host machine are connected with the serial and parallel interface. The PG-1500 is controlled by PG-1500 controller on the host machine.			
		Host machine	OS	Supply media	Part No. (product name)
		PC-9800 Series	MS-DOS (Ver. 3.30 to Ver. 6.2 Note)	3.5-inch, 2HD	μ S5A13PG1500
				5-inch, 2HD	μ S5A10PG1500
		IBM PC/AT and compatible machines	See 8.4.	3.5-inch, 2HD	μ S7B13PG1500
5-inch, 2HC	μ S7B10PG1500				

Note Although there is a task swap function in Ver. 5.00 or later, the task swap function cannot be used in this software.

- Remarks**
1. xxxx: The product name differs with the target device and package.
 2. PG-1500 controller operation is guaranteed only for the operating systems and host machines described above.

8.3.2 PROM programmer adapter list

Target device	Package	PROM programmer	PROM programmer adapter
μ PD75P0016CU, μ PD75P0116CU	42-pin SDIP (600 mil)	PG-1500	PA-75P008CU

μ PD75P4308GS	36-pin SSOP (300 mil)		PA-75P4308GS

8.4 Operating Systems for the IBM PC

The following operating systems are supported for IBM PCs.

OS	Version
PC DOS™	Ver. 3.1 - Ver 6.3, J6.1/V Note - J6.3/V Note
MS-DOS	Ver. 5.0 - Ver 6.22 5.0/V Note - 6.2/V Note
IBM DOS™	J5.02/V Note

Note Only the English mode is supported.

Caution Although there is a task swap function in Ver. 5.00 or later versions, the task swap function cannot be used in this software.

9. 75XL SERIES DOCUMENT LIST

The related documents indicated in this publication may include preliminary versions. However, preliminary versions are not marked as such.

9.3.2 Software

Document		Number
RA75X Assembler Package	Operation	EEU-1346
	Language	EEU-1363
PG-1500 controller	PC-9800 series (MS-DOS) base	EEU-1291
	IBM PC series (PC DOS) base	U10540E

Remark The description of the IE control program is given in IE-75000-R/IE-75001-R User's Manual (EEU-1455).

10. PROCEDURE FOR ORDERING MASK ROMS

Follow the procedure given below when program development ends and the mask ROM is ordered.

<1> Contracting mask ROM order

Contact your local representative or the NEC sales department to schedule a mask ROM order. (If not, arrangements may be late.)

<2> Creating the order media

The following three media are available for the mask ROM order.

- UV-EPROM ^{Note}
- 3.5 inch IBM formatted floppy diskettes (only overseas)
- 5-inch IBM formatted floppy diskettes (only overseas)

Note When you order the media in UV-EPROM, create the three same UV-EPROM.

Fill in the mask option data in the mask option data sheet.

<3> Creating the required documents

Enter the following documents to order a mask ROM.

- A. Mask ROM order form
- B. Mask ROM order check sheet
- C. Mask option data sheet

<4> Order

The media created in <2> and the documents filled out in <3> are collected and given to the local representative or sales department by the reserved order date.

Remark For details, see the information document ROM Code Ordering Procedure (C10302E).

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.
