## 8-bit Proprietary Microcontroller

## cmos

## F²MC-8L MB89920 Series

## MB89923/925/P928/PV920

## ■ DESCRIPTION

The MB89920 series is a line of single-chip microcontrollers using the $\mathrm{F}^{2} \mathrm{MC}^{*}-8 \mathrm{~L}$ CPU core which can operate at low voltage but at high speed.
The microcontrollers in this series contain peripheral functions such as a PWM timer, an input capture/output compare control counter, an LCD controller/driver, an A/D converter, and a UART.
The MB89920 series can suit a wide range of applications such as analog input conversion, pulse input measurement/pulse output control, serial communications control, and display control.
*: F²MC stands for FUJITSU Flexible Microcontroller.

## - FEATURES

- High speed processing at low voltage

Minimum execution time: $0.5 \mu \mathrm{~s} / 8.0 \mathrm{MHz}$

- F²MC-8L family CPU core

Instruction set optimized for controllers

Multiplication and division instructions
16-bit arithmetic operations
Test and branch instructions Bit manipulation instructions, etc.

- 8-bit PWM timer: 2 channels (also usable as a reload timer)
- 16 -bit input capture: 2 channels / 16 -bit output compare: 2 channels
(Continued)

## PACKAGE

| $80-$ pin Plastic QFP |  |
| :--- | :--- |
| (FPT-80P-M06) | 80-pin Ceramic MQFP |
| (MQP-80C-P01) |  |

## MB89920 Series

(Continued)

- 20-bit time-base counter
- UART: 1 channel (with asynchronous transfer mode and 8-bit synchronous serial mode)
- 8-bit serial interface: 1 channel (LSB first/MSB first selectability)
- 10-bit A/D converter: 8 channels
- LCD controller/driver: 28 segments $\times 4$ commons (max. 112 pixels)
- Low-voltage detection reset
- Watchdog timer reset
- External interrupt: 4 channels

Four channels are independent and capable of wake-up from the low-power consumption mode (with edge detection function)

- Buzzer output/clock output
- Low-power consumption modes:

Stop mode (The software stops oscillation to minimize the current consumption.)
Sleep mode (The CPU stops to reduce current consumption to approx. $1 / 3$ of normal.)
Hardware standby mode (The pin input stops oscillation.)

| :---: | :---: | :---: |
| FPT-80P-M06 | $\bigcirc$ | $\times$ |
| MQP-80C-P01 | $\times$ | $\bigcirc$ |

$\bigcirc$ : Available $\quad \times$ : Not available
Note: For more information about each package, see section "■ Package Dimensions."

## DIFFERENCES AMONG PRODUCTS

## 1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

- The stack area, etc., is set at the upper limit of the RAM.
- The external area is used.

## 2. Current Consumption

- In the case of the MB89PV920, add the current consumed by the EPROM which is connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM.

However, the current consumption in sleep/stop modes is the same. (For more information, see section "■ Electrical Characteristics.")

## 3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.
Before using options check section "■ Mask Options."

## PIN ASSIGNMENT

| :---: | :---: | :---: |
| F |  | - N-ch open-drain I/O <br> - Also serves as LCD controller/driver common/ segment output. |
| G |  | - CMOS I/O <br> - Analog input |

## HANDLING DEVICES

## 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than $\mathrm{V}_{\mathrm{cc}}$ or lower than $\mathrm{V}_{\text {ss }}$ is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics" is applied between $\mathrm{V}_{\mathrm{cc}}$ and $\mathrm{V}_{\mathrm{ss}}$.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.
Also, take care to prevent the analog power supply ( AV Vc and AVR ) and analog input from exceeding the digital power supply $\left(V_{c c}\right)$ when the analog system power supply is turned on and off.

## 2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

## 3. Treatment of Power Supply Pins on Microcontrollers with A/D and D/A Converters

Connect to be $\mathrm{AV} \mathrm{cc}=\mathrm{DAVC}=\mathrm{V}_{\mathrm{cc}}$ and $\mathrm{AV} \mathrm{ss}=\mathrm{AVR}=\mathrm{V}_{\mathrm{ss}}$ even if the $\mathrm{A} / \mathrm{D}$ and $\mathrm{D} / \mathrm{A}$ converters are not in use.

## 4. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

## 5. Power Supply Voltage Fluctuations

Although $V_{c c}$ power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that Vcc ripple fluctuations (P-P value) will be less than $10 \%$ of the standard Vcc value at the commercial frequency ( 50 to 60 Hz ) and the transient fluctuation rate will be less than $0.1 \mathrm{~V} / \mathrm{ms}$ at the time of a momentary fluctuation such as when power is switched.

## 6. Precautions when Using an External Clock

Even when an external clock is used, oscillation stabilization time is required for power-on reset (optional) and wake-up from stop mode.

## PROGRAMMING TO THE EPROM ON THE MB89P928

The MB89P928 is an OTPROM version of the MB89920 series.

## 1. Features

- 48-Kbyte PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C1001A in EPROM mode (when programmed with the EPROM programmer)

## 2. Memory Space

Memory space in the EPROM mode is diagrammed below.

## MB89920 Series

## 3.Programming to the EPROM

In EPROM mode, the MB89P928 functions equivalent to the MBM27C1001A. This allows the PROM to be programmed with a general-purpose EPROM programmer (the electronic signature mode cannot be used) by using the dedicated socket adapter.

- Programming procedure
(1) Set the EPROM programmer to the MBM27C1001A.
(2) Load program data into the EPROM programmer at OFE4н to FFFFн.
(3) Program with the EPROM programmer.

## 4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

## 5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of $100 \%$ cannot be assured at all times.
6. EPROM Programmer Socket Adapter

| Package | Compatible socket adapter |
| :---: | :---: |
| FPT-80P-M06 | ROM-80QF-32DP-8LA |

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760
Note: Depending on the EPROM programmer, inserting a capacitor of about $0.1 \mu \mathrm{~F}$ between $\mathrm{V}_{\mathrm{PP}}$ and $\mathrm{V}_{\text {ss }}$ or $\mathrm{V}_{\mathrm{cc}}$ and $\mathrm{V}_{\text {ss }}$ can stabilize programming operations.

## 7. PROM Option Bit Map

Notes: • Set each bit to 1 to erase.

- Do not write 0 to the vacant bit.

The read value of the vacant bit is 1 , unless 0 is written to it.

- Write the same value as each option register to the 3-byte vacant address that follows above option registers.
Example: In the case of 0FE4н, write the same value to 0FE5, OFE6 and 0FF7н.
- This optional information is taken into the OTPROM while the oscillation is being reset. Therefore, if the hardware state is initially shifted to standby state after the power supply is turned on, the optional information will not be valid during the transition (in a state of the initial value 1).
After the hardware standby state is cleared, the oscillation starts and the optional information becomes valid.
Note that if the hardware is shifted to the standby or stop state in the course of a normal operation (oscillation), the contents of the optional register are valid since the option data has already been taken into the OTPROM.

## MB89920 Series

## PROGRAMMING TO THE EPROM WITH PIGGYBACK/EVALUATION DEVICE

## 1. EPROM for Use

MBM27C512-20TV

## 2. Programming Socket Adapter

To program to the PROM using an EPROM programmer, use the socket adapter (manufacturer: Sun Hayato Co., Ltd.) listed below.

| Package | Adapter socket part number |
| :--- | :--- |
| LCC-32(Rectangle) | ROM-32LC-28DP-YG |
| LCC-32(Square) | ROM-32LC-28DP-S |

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760

## 3. Memory Space

Memory space in each mode is diagrammed below.

## 4. Programming to the EPROM

(1) Set the EPROM programmer to the MBM27C512.
(2) Load program data into the EPROM programmer at 4000 to $\operatorname{FFFF}$ н.
(3) Program to 4000 н to FFFFH with the EPROM programmer.

## BLOCK DIAGRAM

## MB89920 Series

## CPU CORE

## 1. Memory Space

The microcontrollers of the MB89920 series offer a memory space of 64 Kbytes for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89920 series is structured as illustrated below.

## MB89920 Series

## 2. Registers

The $\mathrm{F}^{2} \mathrm{MC}-8 \mathrm{~L}$ family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

Program counter (PC): A 16-bit register for indicating instruction storage positions
Accumulator (A):
A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8 -bit data processing instruction, the lower byte is used.

Temporary accumulator ( T ): A 16-bit register which performs arithmetic operations with the accumulator When the instruction is an 8 -bit data processing instruction, the lower byte is used.

Index register (IX):
A 16-bit register for index modification
Extra pointer (EP):
A 16-bit pointer for indicating a memory address
Stack pointer (SP):
A 16-bit register for indicating a stack area
Program status (PS):
A 16-bit register for storing a register pointer, a condition code

| 16 bits |  | Initial value |
| :---: | :---: | :---: |
| PC | : Program counter | FFFD ${ }_{\text {н }}$ |
| A | : Accumulator | Undefined |
| T | : Temporary accumulator | Undefined |
| IX | : Index register | Undefined |
| EP | : Extra pointer | Undefined |
| SP | : Stack pointer | Undefined |
| PS | : Program status I-fla | $=0, \mathrm{IL} 1,0$ |

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

## Structure of the Program Status Register

The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

## Rule for Conversion of Actual Addresses of the General-purpose Register Area

The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

H-flag: Set when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared otherwise. This flag is for decimal adjustment instructions.
I-flag: Interrupt is allowed when this flag is set to 1 . Interrupt is prohibited when the flag is set to 0 . Set to 0 when reset.

IL1, 0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

| IL1 | ILO | Interrupt level | High-low |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | High |
| 0 | 1 |  |  |
| 1 | 0 | 2 |  |
| 1 | 1 | 3 | Low $=$ no interrupt |

N-flag: Set if the MSB is set to 1 as the result of an arithmetic operation. Cleared when the bit is set to 0 .
Z-flag: Set when an arithmetic operation results in 0 . Cleared otherwise.
V-flag: Set if the complement on 2 overflows as a result of an arithmetic operation. Reset if the overflow does not occur.

C-flag: Set when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared otherwise. Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:
General-purpose registers: An 8-bit register for storing data
The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers and up to a total of 16 banks can be used on the MB89925. Up to a total of 16 banks can be used on the MB89923. The bank currently in use is indicated by the register bank pointer (RP).
Note: The number of register banks that can be used varies with the RAM size.

## Register Bank Configuration

## ELECTRICAL CHARACTERISTICS

## 1. Absolute Maximum Ratings

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| Power supply voltage | V cc | Vss-0.3 | Vss +7.0 | V |  |
|  | AV ${ }_{\text {cc }}$ | Vss-0.3 | V cc +0.3 | V | *1 |
|  | AVR | Vss-0.3 | Vss +7.0 | V | AVR must not exceed AV cc +0.3 V. |
| LCD power supply voltage | V1 to V3 | Vss - 0.3 | Vss +7.0 | V | $\mathrm{V} 1 \leq \mathrm{V} 2 \leq \mathrm{V} 3$ *2 |
| Input voltage | $\mathrm{V}_{11}$ | Vss - 0.3 | $\mathrm{V} \mathrm{cc}+0.3$ | V |  |
| Output voltage | Vo1 | Vss-0.3 | $\mathrm{V} \mathrm{cc}+0.3$ | V | P00 to P07, P10 to P17, P20 to P27, P30 to P32, P90 to P97 |
|  | Vo2 | Vss-0.3 | Vss +7.0 | V | P40 to P45, P50 to P57, P60 to P67, P70 to P77, P80 to P83 Must not exceed " $V 3+0.3 \mathrm{~V}$ " |
| "L" level maximum output current | lob | - | 20 | mA | Peak value |
| "L" level average output current | lolav | - | 4 | mA | Average value |
| "L" level total maximum output current | 「loL | - | 100 | mA | Peak value |
| "L" level total average output current | Elodav | - | 40 | mA | Average value |
| " H " level maximum output current | Іон | - | -20 | mA | Peak value |
| "H" level average output current | Iohav | - | -4 | mA | Average value |
| " H " level total maximum output current | £ ${ }_{\text {lo }}$ | - | -50 | mA | Peak value |
| " H " level total average output current | $\sum$ lohav | - | -20 | mA | Average value |
| Power consumption | Po | - | 300 | mW |  |
| Operating temperature | $\mathrm{T}_{\text {A }}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |
| Storage temperature | Tstg | -55 | +150 | ${ }^{\circ} \mathrm{C}$ |  |

*1: Use AV cc and $\mathrm{V}_{\mathrm{cc}}$ set at the same voltage.
Take care so that AV cc does not exceed Vcc , such as when power is turned on.
*2: Vcc must not exceed V3.
Precautions: Permanent device damage may occur if the above "Absolute Maximum Ratings" are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## MB89920 Series

## 2. Recommended Operating Conditions

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| Power supply voltage | Vcc | 2.2*1 | 6.0 | V | Normal operation assurance range |
|  |  | $2.7^{* 1}$ | 6.0 | V | MB89PV920/P928 |
|  |  | 1.5 | 6.0 | V | Retains the RAM state in stop mode |
| A/D converter reference input voltage | AVR | 3.0 | AV ${ }_{\text {cc }}$ | V |  |
| LCD power supply voltage | V1 to V3 | Vss | Vss +6.0 | V | $\mathrm{V} 1 \leq \mathrm{V} 2 \leq \mathrm{V} 3^{*} 2$ |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |

*1: These values vary with the operating frequency, instruction cycle, and analog assurance range. See Figure 1 and " 5 . A/D Converter Electrical Characteristics."
*2: Vcc must not exceed V3.

Figure 1 Operating Voltage vs. Clock Operating Frequency
Figure 1 indicates the operating frequency of the external oscillator at an instruction cycle of $4 / \mathrm{Fc}$.
Since the operating voltage range is dependent on the instruction cycle, see minimum execution time if the operating speed is switched using a gear.

| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Min. | Max. |  |  |
| Power supply rising time | tR | - | - | 50 | ms | Power-on reset function only |
| Power supply cut-off time | toff |  | 1 | - | ms | Due to repeated operations |

Note: Make sure that power supply rises within the selected oscillation stabilization time.
If power supply voltage needs to be varied in the course of operation, a smooth voltage rise is recommended.

## 5. A/D Converter Electrical Characteristics

| Parameter | $\begin{aligned} & \text { Sym- } \\ & \text { bol } \end{aligned}$ | Pin | Condition | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Min. | Typ. | Max. |  |
| Resolution | - | - | $\begin{aligned} & \mathrm{AV}_{\mathrm{cc}}=\mathrm{AVR}= \\ & \mathrm{V}_{\mathrm{cc}} \end{aligned}$ | - | - | 10 | bit |
| Linearity error |  |  |  | - | - | $\pm 2.0$ | LSB |
| Differential linearity error |  |  |  | - | - | $\pm 1.5$ | LSB |
| Differential total error |  |  |  | - | - | $\pm 3.0$ | LSB |
| Zero transition voltage | Vот | AN0 to AN7 |  | AVss 1.5 LSB | AVss + 0.5 LSB | AVss + 2.5 LSB | mV |
| Full-scale transition voltage | $V_{\text {fst }}$ | AN0 to AN7 |  | AVR - 3.5 LSB | AVR-1.5 LSB | AVR + 0.5 LSB | mV |
| Interchannel disparity | - | - |  | - | - | 4 | LSB |
| A/D mode conversion time |  |  |  | - | - | 16.5 | $\mu \mathrm{s}$ |
| Analog port input current | Vain | AN0 to AN7 | At 8-MHz oscillattion | - | - | 10 | $\mu \mathrm{A}$ |
| Analog input voltage | - | AN0 to AN7 |  | 0.0 | - | AVR | V |
| Reference voltage |  | AVR |  | 0.0 | - | AV ${ }_{\text {cc }}$ | V |
| Reference voltage supply current | If | AVR | $\mathrm{AVR}=5.0 \mathrm{~V}$ | - | 200 | - | $\mu \mathrm{A}$ |

Precautions: • The smaller | AVR - AVss |, the greater the error would become relatively.

- The output impedance of the external circuit for the analog input must satisfy the following conditions: Output impedance of the external circuit < Approx. $10 \mathrm{k} \Omega$ If the output impedance of the external circuit is too high, an analog voltage sampling time might be insufficient (sampling time $=7.5 \mu \mathrm{~s}$ at 8 MHz oscillation).

An analog input equivalent circuit is shown below.

Since the A/D converter contains sample hold circuit, the level of the analog input pin might not stabilize within the sampling period after $A / D$ activation, resulting in inaccurate $A / D$ conversion values, if the input impedance to the analog pin is too high. Be sure to maintain an appropriate input impedance to the analog pin.
It is recommended to keep the input impedance to the analog pin not exceed $10 \mathrm{k} \Omega$. If it exceeds $10 \mathrm{k} \Omega$, it is recommended to connect a capacitor of about $0.1 \mu \mathrm{~F}$ for the analog input pin.
Except for the sampling period after A/D activation, the input leakage current of the analog input pin is less than $10 \mu \mathrm{~A}$.

## MB89920 Series

## (1) A/D Converter Glossary

- Resolution

Analog changes that are identifiable with the A/D converter.

- Linearity error

The deviation of the straight line connecting the zero transition point ("00 0000 0000" "00 00000001 ") with the full-scale transition point ("11 1111 1111" " "11 1111 1110") from actual conversion characteristics

- Differential linearity error

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

- Total error

The difference between theoretical and actual conversion values, caused by the zero transition error, full-scale transition error, linearity error, quantization error, and noise.

(Continued)

## MB89920 Series

## 6. Low-voltage Detection Reset

| Parameter | Symbol | Condition | ( $\mathrm{AV}_{\text {ss }}=$ | ss $=0.0$ | $\mathrm{T}_{\mathrm{A}}=-4$ | ${ }^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Value |  | Unit | Remarks |
|  |  |  | Min. | Max. |  |  |
| Voltage detected at power supply voltage drop | Vol1 |  | 3.00 | 3.60 | V | *1 |
|  | VDL2 |  | 3.30 | 3.90 | V |  |
|  | Vdı3 |  | 3.70 | 4.30 | V |  |
| Voltage detected at power supply voltage rise | Vob1 |  | 3.10 | 3.80 | V |  |
|  | V ${ }_{\text {DH2 }}$ |  | 3.40 | 4.10 | V |  |
|  | Vонз |  | 3.80 | 4.50 | V |  |
| Hysteresis width | $\Delta \mathrm{V}$ |  | 0.10 | - | V |  |
| Reset ignore time | tı |  | 0.3 | - | $\mu \mathrm{s}$ |  |
| Reset sense time | tıw |  | 16 txcyL | - | ns |  |
| Reset detection deley time | to |  | - | 2.0 | $\mu \mathrm{s}$ |  |
| Voltage regulation (V $\Delta / \mathrm{t} \Delta$ ) | VCR |  | - | 0.10 | V/ $/$ s |  |

*1: VDH and VDL can be set for the MB89923 and MB89925 by mask options; for the MB89PV920 and MB89P928 by registers.

## - INSTRUCTIONS (136 INSTRUCTIONS)

Execution instructions can be divided into the following four groups:

- Transfer
- Arithmetic operation
- Branch
- Others

Table 1 lists symbols used for notation of instructions.
Table 1 Instruction Symbols

| Symbol | Meaning |
| :---: | :---: |
| dir | Direct address (8 bits) |
| off | Offset (8 bits) |
| ext | Extended address (16 bits) |
| \#vct | Vector table number (3 bits) |
| \#d8 | Immediate data (8 bits) |
| \#d16 | Immediate data (16 bits) |
| dir: b | Bit direct address (8:3 bits) |
| rel | Branch relative address (8 bits) |
| @ | Register indirect (Example: @A, @IX, @EP) |
| A | Accumulator A (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| AH | Upper 8 bits of accumulator A (8 bits) |
| AL | Lower 8 bits of accumulator A (8 bits) |
| T | Temporary accumulator T (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| TH | Upper 8 bits of temporary accumulator T (8 bits) |
| TL | Lower 8 bits of temporary accumulator T (8 bits) |
| IX | Index register IX (16 bits) |
| EP | Extra pointer EP (16 bits) |
| PC | Program counter PC (16 bits) |
| SP | Stack pointer SP (16 bits) |
| PS | Program status PS (16 bits) |
| dr | Accumulator A or index register IX (16 bits) |
| CCR | Condition code register CCR (8 bits) |
| RP | Register bank pointer RP (5 bits) |
| Ri | General-purpose register Ri (8 bits, i=0 to 7) |
| $\times$ | Indicates that the very $x$ is the immediate data. (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| ( $\times$ ) | Indicates that the contents of $x$ is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| (( $\times$ ) | The address indicated by the contents of $x$ is the target of accessing. (Whether its length is 8 or 16 bits is determined by the instruction in use.) |

Columns indicate the following:
Mnemonic: Assembler notation of an instruction
$\sim$ : The number of instructions
\#: $\quad$ The number of bytes
Operation: Operation of an instruction
TL, TH, AH: A content change when each of the TL, TH, and AH instructions is executed. Symbols in the column indicate the following:

- "-" indicates no change.
- dH is the 8 upper bits of operation description data.
- AL and AH must become the contents of AL and AH prior to the instruction executed.
- 00 becomes 00 .
$\mathrm{N}, \mathrm{Z}, \mathrm{V}, \mathrm{C}: \quad$ An instruction of which the corresponding flag will change. If + is written in this column, the relevant instruction will change its corresponding flag.
OP code: Code of an instruction. If an instruction is more than one code, it is written according to the following rule:
Example: 48 to $4 \mathrm{~F} \leftarrow$ This indicates $48,49, \ldots 4 \mathrm{~F}$.

## MB89920 Series

All Rights Reserved.
The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).
CAUTION:
Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
