T-46-13-29
T-46-13-25

Features

- Low Power CMOS Operation
100 μ A max. Standby
30 mA max. Active at 5 MHz (AT27C1024L)
50 mA max. Active at 5 MHz (AT27C1024)
- Fast Read Access Time - 120ns
- Wide Selection of JEDEC Standard Packages Including OTP
40-Lead 600 mil Cerdip and OTP Plastic DIP
44-Pad LCC and OTP PLCC
- 5V \pm 10% Supply
- High Reliability CMOS Technology
2000V ESD Protection
200mA Latchup Immunity
- Rapid Programming - 100 μ s/word (typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Full Military, Commercial and Industrial Temperature Ranges

Description

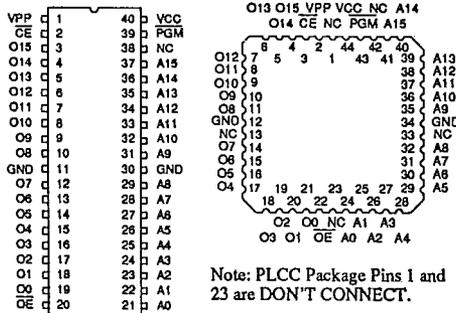

The AT27C1024/L chip family is a low-power, high performance 1,048,576 bit Ultraviolet Erasable and Electrically Programmable Read Only Memory (EPROM) organized 64K x 16. They require only one 5V power supply in normal read mode operation. Any word can be accessed in less than 120ns, eliminating the need for speed reducing WAIT states. The by-16 organization makes these parts ideal for high-performance 16 and 32 bit microprocessor systems.

Two power versions are offered. In read mode, the AT27C1024 typically consumes 30mA while the AT27C1024L takes only 15mA. Standby mode supply current for both parts is typically less than 20 μ A.

Pin Configurations

Pin Name	Function
A0-A15	Addresses
O0-O15	Outputs
CE	Chip Enable
OE	Output Enable
PGM	Program Strobe
NC	No Connect

Note: Both GND pins must be connected.

Description (Continued)

The AT27C1024/L come in a choice of industry standard JEDEC-approved packages including; 40-pin DIP in ceramic or one time programmable (OTP) plastic, and 44-pad ceramic leadless chip carrier (LCC), or OTP plastic J-leaded chip carrier (PLCC). All devices feature two line control (\overline{CE} , \overline{OE}) to give designers the flexibility to prevent bus contention.

With high density 64K word storage capability, the AT27C1024/L allow firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

Atmel's 27C1024/L have additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μ s/word. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages.

Absolute Maximum Ratings*

Temperature Under Bias	-55°C to +125°C
Storage Temperature.....	-65°C to +150°C
Voltage on Any Pin with Respect to Ground.....	-2.0V to +7.0V ⁽¹⁾
Voltage on A9 with Respect to Ground	-2.0V to +14.0V ⁽¹⁾
V _{PP} Supply Voltage with Respect to Ground.....	-2.0V to +14.0V ⁽¹⁾
Integrated UV Erase Dose.....	7258 W·sec/cm ²

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Erasure Characteristics

The entire memory array of the AT27C1024/L is erased (all outputs read as V_{OH}) after exposure to ultraviolet light at a wavelength of 2537Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000 μ W/cm² intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of 15W·sec/cm². To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

Notes:

1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is V_{CC}+0.75V dc which may overshoot to +7.0V for pulses of less than 20ns.

- Notes:
1. X can be V_{IL} or V_{IH}.
 2. Refer to Programming characteristics.
 3. V_{IH} = 12.0 \pm 0.5V.
 4. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.
 5. Standby V_{CC} current (I_{SB}) is specified with V_{PP}=V_{CC}. V_{CC} > V_{PP} will cause a slight increase in I_{SB}.

Notes:

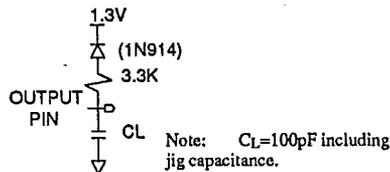

1. Timing measurement references are 0.8V and 2.0V. Input AC driving levels are 0.45V and 2.4V, unless otherwise specified.
2. \overline{OE} may be delayed up to $t_{CE-t_{OE}}$ after the falling edge of \overline{CE} without impact on t_{CE} .
3. \overline{OE} may be delayed up to $t_{ACC-t_{OE}}$ after the address is valid without impact on t_{ACC} .
4. This parameter is only sampled and is not 100% tested.
5. Output float is defined as the point when data is no longer driven.

Notes:

1. The Input Timing Reference is 0.8V for V_{IL} and 2.0V for V_{IH}.
2. t_{OE} and t_{DFP} are characteristics of the device but must be accommodated by the programmer.
3. When programming the AT27C1024/L a 0.1 μF capacitor is required across V_{PP} and ground to suppress spurious voltage transients.

Rapid Programming Algorithm

A 100 μs PGM pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μs PGM pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a word fails to pass verification, up to 10 successive 100 μs pulses are applied with a verification after each pulse. If the word fails to verify after 10 pulses have been applied, the part is considered failed. After the word verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0V and V_{CC} to 5.0V. All words are read again and compared with the original data to determine if the device passes or fails.
