

### GENERAL DESCRIPTION

The AK4117 is a S/PDIF AES/EBU receiver supporting sample rates up to 192kHz and resolution up to 24-bit. The integrated channel status decoder supports both consumer and professional modes. The AK4117 can automatically detect a Non-PCM bit stream. Combining the AK4117 with a multi-channel codec such as AKM's AK4527B or AK4529 can create a complete AC-3 system. Mode settings can be controlled via microprocessor serial interface. A low power mode is available for normal speed modes and the small 24pin VSOP package saves board space.

\*AC-3 is a trademark of Dolby Laboratories.

### FEATURES

- AES3, IEC60958, S/PDIF, EIAJ CP1201 Compatible
- Low jitter Analog PLL
- PLL Lock Range : 32kHz to 192kHz
- Clock Source: PLL or X'tal
- 2-channel Receiver inputs Selector
- Auxiliary digital input
- Detection Functions
  - Non-PCM Bit Stream Detection
  - DTS-CD Bit Stream Detection
  - Sampling Frequency Detection  
(32kHz, 44.1kHz, 48kHz, 88.2kHz, 96kHz, 176.4kHz, 192kHz)
  - Unlock & Parity Error Detection
  - Validity Flag Detection
- Up to 24bit Audio Data Format
- Audio I/F: Left justified, Right justified (16bit, 18bit, 20bit, 24bit), I<sup>2</sup>S
- 40-bit Channel Status Buffer
- Burst Preamble bit Pc and Pd Buffer for Non-PCM bit stream
- Q-subcode Buffer for CD bit stream
- 4-wire Serial  $\mu$ P I/F
- Master Clock Output: 128fs/256fs/512fs
- Operating Voltage: 2.7 to 3.6V
- Small Package: 24pin VSOP
- Ta: -40 to 85°C

**OPERATION OVERVIEW**

■ **Non-PCM (AC-3, MPEG, etc.) and DTS-CD Bitstream Detection**

The AK4117 has a Non-PCM steam auto-detection function. When the 32-bit mode Non-PCM preamble based on Dolby “AC-3 Data Stream in IEC60958 Interface” is detected, the NPCM bit goes to “1”. The 96-bit sync code consists of 0x0000, 0x0000, 0x0000, 0x0000, 0xF872 and 0x4E1F. Detection of this pattern will set the NPCM to “1”. Once the NPCM is set to “1”, it will remain “1” until 4096 frames pass through the chip without an additional sync pattern being detected (Timing diagram: Figure 27 and Figure 28). When those preambles are detected, the burst preambles Pc (burst information: Table 10) and Pd (length code: Table 11) that follow those sync codes are stored to registers. The AK4117 also has a DTS-CD bitstream auto-detection function. When AK4117 detects DTS-CD bitstreams, the DTSCD bit goes to “1”. If the next sync code does not occur within 4096 frames, the DTSCD bit goes to “0” until either the AK4117 detects the stream again. OR’ed value of the NPCM and DTSCD bits are output to the AUTO bit. The AK4117 detects 14bit sync word of a DTS-CD bitstream, while it does not detect 16bit sync word (0x7FFE8001).

■ **192kHz Clock Recovery**

The on-chip, low jitter PLL has a wide lock range of 32kHz to 192kHz and a lock time of less than 20ms. The AK4117 has a sampling frequency detect function (32kHz, 44.1kHz, 48kHz, 88.2kHz, 96kHz, 176.4kHz and 192kHz) that uses either clock comparison against the X’tal oscillator or the channel status information. The PLL loses lock when the received sync interval is incorrect.

■ **Clock Operation Mode**

The AK4117 has two sources for MCKO and SDTO.

- 1) MCKO and SDTO source is recovered by PLL from RX input.
- 2) MCKO source is X’tal or External clock. SDTO source is DAUX input.

The CM1-0 bits select the clock operation mode (Table 1). In Mode 2, the clock source is switched from PLL to X’tal when the PLL loses lock. In Mode3, even though the clock source is fixed to X’tal, the PLL is also operating. This allows the monitoring of recovered data such as C bits. For Mode2 and 3, it is recommended that the X’tal frequency and PLL recovery frequency be set differently.

Mode	CM1	CM0	UNLCK	PLL	X’tal	Clock source	SDTO
0	0	0	-	ON	ON(Note)	PLL	RX
1	0	1	-	OFF	ON	X’tal	DAUX
2	1	0	0	ON	ON	PLL	RX
			1	ON	ON	X’tal	DAUX
3	1	1	-	ON	ON	X’tal	DAUX

Default

ON: Oscillation (Power-up), OFF: STOP (Power-down)

Note : When the X’tal is not used as clock comparison for fs detection (i.e. XTL1,0= “1,1”), the X’tal is off.

Table 1. Clock Operation Mode select

## ■ Master Clock Output

The AK4117 has a master clock output pin, MCKO. In PLL mode, PCKS1-0 bits select the MCKO frequency as shown in Table 2. When MCKO=512fs, MCKO goes to “L” when fs=96kHz and 192kHz. When MCKO=256fs, MCKO goes to “L” when fs=192kHz. When LP bit is set to “1”, the AK4117 is in low power mode (default). In low power mode, PLL lock range is up to 48kHz and the MCKO frequency is fixed to 256fs.

In the X'tal mode, XCKS1-0 bits select the ratio of the X'tal frequency to fs (sampling frequency). The DIV bit selects the ratio (x1 or x1/2) of the MCKO frequency to the X'tal frequency (Table 3).

LP	PCKS1	PCKS0	MCKO	fs [kHz]
0	0	0	512fs	32 ~ 48
	0	1	256fs	32 ~ 96
	1	0	128fs	32 ~ 192
	1	1	N/A	N/A
1	x	x	256fs	32 ~ 48

Default

Table 2. Master Clock Frequency Select  
(PLL mode: Clock operation mode 0, 2(UNLCK=0))

XCKS1	XCKS0	X'tal or EXT	MCKO		fs [kHz]					
					EXTCLK [MHz]			X'tal [MHz]		
			DIV=0	DIV=1	2.048	4.096	8.192	11.2896	12.288	24.576
0	0	128fs	128fs	64fs	16	32	64	88.2	96	192
0	1	256fs	256fs	128fs	8	16	32	44.1	48	96
1	0	512fs	512fs	256fs	N/A	8	16	N/A	N/A	48
1	1	1024fs	1024fs	512fs	N/A	N/A	8	N/A	N/A	N/A

Default

Table 3. Master Clock Frequency Select  
(X'tal mode: Clock operation mode 1, 2(UNLCK=1), 3)

■ Clock Source

The following circuits are available to feed a clock into the XTI pin of AK4117.

1) X'tal mode

The X'tal with proper value should be connected between XTI and XTO pins.

Figure 8. X'tal mode (EXCK= "0")

Note: External capacitance depends on the crystal oscillator (Typ.10-40pF).

2) External clock mode

EXCK bit should be set to "1" and the proper frequency clock input into the XTI pin. XTO pin should be left open.

Figure 9. External clock mode (EXCK= "1")

3) OFF mode

CM1-0 bits should be set to "00" and XTL1-0 bits to "11" respectively. XTI and XTO pins should be left open. The XTI pin can also be connected to ground externally.

Figure 10. OFF mode (CM1-0= "00", XTL1-0= "11")

■ Sampling Frequency and Pre-emphasis Detection

The AK4117 has two methods for detecting the sample frequency:

- 1) Clock comparison between recovered clock and the X'tal oscillator  
 FS3-0 bits indicate the detected RX input frequency referred to X'tal frequency. XTL1-0 bits select the reference X'tal frequency (Table 4).
- 2) Sampling frequency information on channel status  
 When XTL1-0= "11", FS3-0 bits indicate the decoded sampling frequency information from channel status.

XTL1	XTL0	X'tal Frequency	
0	0	11.2896MHz	Default
0	1	12.288MHz	
1	0	24.576MHz	
1	1	(Use channel status)	

Table 4. Reference X'tal frequency

Register output				fs	Except XTL1-0= "11"	XTL1-0= "11"		
					Clock comparison (Note 1)	Consumer mode (Note 2)	Professional mode	
FS3	FS2	FS1	FS0			Byte3 Bit3,2,1,0	Byte0 Bit7,6	Byte4 Bit6,5,4,3
0	0	0	0	44.1kHz	44.1kHz ± 3%	0000	01	0000
0	0	0	1	Reserved	Reserved	0001	(Others)	
0	0	1	0	48kHz	48kHz ± 3%	0010	10	0000
0	0	1	1	32kHz	32kHz ± 3%	0011	11	0000
1	0	0	0	88.2kHz	88.2kHz ± 3%	(1000)	00	1010
1	0	1	0	96kHz	96kHz ± 3%	(1010)	00	0010
1	1	0	0	176.4kHz	176.4kHz ± 3%	(1100)	00	1011
1	1	1	0	192kHz	192kHz ± 3%	(1110)	00	0011

Note 1: At least ±3% range is identified as the value in the Table 5. In case of an intermediate frequency of these two, FS3-0 bits indicate the nearer value. When the frequency is much larger than 192kHz or much smaller than 32kHz, FS3-0 bits may indicate "0001".

Note 2: In consumer mode, Byte3 Bit3-0 are copied to FS3-0.

Table 5. Sampling frequency information

The pre-emphasis information is detected and reported on the PEM bit. This information is extracted from channel 1 by default (CS12=0). It can be switched to channel 2 by changing the CS12 bit in the control register.

PEM	Pre-emphasis	Consumer mode	Professional mode
		Byte 0 Bits 3-5	Byte 0 Bits 2-4
0	OFF	≠ 0X100	≠ 110
1	ON	0X100	110

Table 6. Pre-emphasis information

■ System Reset and Power-Down

The AK4117 has a full power-down mode for all circuits that is activated by the PDN pin, and a partial power-down mode activated by the PWN bit. The RSTN bit initializes the internal registers and timing. The AK4117 should be reset once at power-up by bringing PDN pin = “L”.

PDN Pin:

All analog and digital circuits are placed in power-down and reset modes by bringing PDN= “L”. All the registers are initialized and clocks are stopped. Read/write operations to the registers are disabled.

RSTN Bit (Address 00H; D0):

All the registers except RSTN, PWN, XTL1-0 and EXCK are initialized by bringing RSTN bit = “0”. The internal timings are also initialized. When RSTN bit= “0”, clocks are output, but SDTO is “L”. All register writes except RSTN, PWN, XTL1-0 and EXCK are disabled. Reading from the registers is enabled.

PWN Bit (Address 00H; D1):

Clock recovery mode is initialized by bringing PWN bit = “0”. Clocks from the PLL are stopped while the X’tal clocks continue to be output. Unlike the PDN pin operation described above, internal registers and mode settings are not initialized. Read/write operations to the registers are enabled.

■ Biphase Input

Two receiver inputs (RX0 and RX1) are available. Each input includes an amplifier for unbalance loads that can accept 350mVpp or greater signal. The IPS bit selects the receiver channel (Table 7). When the UOUTE bit = “1”, the U bit (user data) can be output from the UOUT pin.

IPS	INPUT Data
0	RX0
1	RX1

Default

Table 7. Recovery Data Select

Figure 11. UOUT output timing

■ Biphase signal input circuit

Figure 12. Consumer Input Circuit (Coaxial Input)

Note: When using a coaxial input, if the coupling level to this input from the next RX input line pattern exceeds 50mV, incorrect operation may occur. This can be reduced or prevented by adding a decoupling capacitor.

Figure 13. Consumer Input Circuit (Optical Input; Using 3.3V Optical Receiver)

■ Q-subcode buffers

The AK4117 has a Q-subcode buffer for CD application. The AK4117 takes Q-subcode into registers under the following conditions:

- 1) The sync word (S0,S1) consists of at least 16 “0”s.
- 2) The start bit is “1”.
- 3) Those 7-bits Q-W follows to the start bit.
- 4) The distance between two start bits is 8-16 bits.

The QINT bit in the control register goes “1” when the new Q-subcode differs from old one, and goes “0” when QINT bit is read.

■ **Interrupt Handling**

There are eight events which cause the INT1-0 pins to go “H”.

1. UNLCK: PLL unlock state detect  
 “1” when the PLL loses lock. The AK4117 loses lock when the distance between two preambles is not correct or when those preambles are not correct.
2. PAR: Parity error or biphas coding error detection  
 “1” when parity error or biphas coding error is detected, updated every sub-frame cycle. Reading this register resets it.
3. AUTO: Non-PCM or DTS-CD Bit Stream detection  
 The OR function of NPCM and DTSCD bits is output to the AUTO bit.
4. V: Validity flag detection  
 “1” when validity flag is detected. Updated every sub-frame cycle.
5. AUDION: Non-audio detection  
 “1” when the “AUDIO” bit in recovered channel status indicates “1”. Updated every block cycle.
6. STC: Sampling frequency or pre-emphasis information change detection  
 “1” when FS3-0 or PEM bit changes. Reading this register resets it.
7. QINT: U bit (Q-subcode) sync flag  
 “1” when the Q-subcode differs from old one, and stays “1” until this register is read. Updated every sync code cycle for Q-subcode. Reading this register resets it.
8. CINT: Channel status sync flag  
 “1” when received C bits differ from old ones, and stays “1” until this register is read. Updated every block cycle. Reading this register resets it.

INT1-0 pins output an OR’ed signal based on the above eight interrupt events. When masked, the interrupt event does not affect the operation of the INT1-0 pins (the masks do not affect the registers (UNLCK, PAR, etc.) themselves). Once INT0 pin goes to “H”, it maintains “H” for 1024 cycles (this value can be changed by the EFH1-0 bits) after all events not masked by mask bits are cleared. INT1 pin immediately goes to “L” when those events are cleared.

UNLCK, AUTO, V and AUDION bits indicate the interrupt status events above in real time. Once PAR, STC, QINT or CINT bit goes to “1”, it stays “1” until the register is read. INT pin holds “H” for one sub-frame, then goes to “L” in this case.

When the AK4117 loses lock, the channel status bits are initialized. In this initial state, INT0 outputs the OR’ed signal between UNLCK and PAR bits. INT1 outputs the OR’ed signal to AUTO, V and AUDION. INT1-0 pins are “L” when the PLL is OFF (Clock Operation Mode 1).

Event			SDTO Pin
UNLCK	PAR	Others	
1	x	x	“L”
0	1	x	Previous Data
0	0	x	Output

Table 8. Interrupt handling

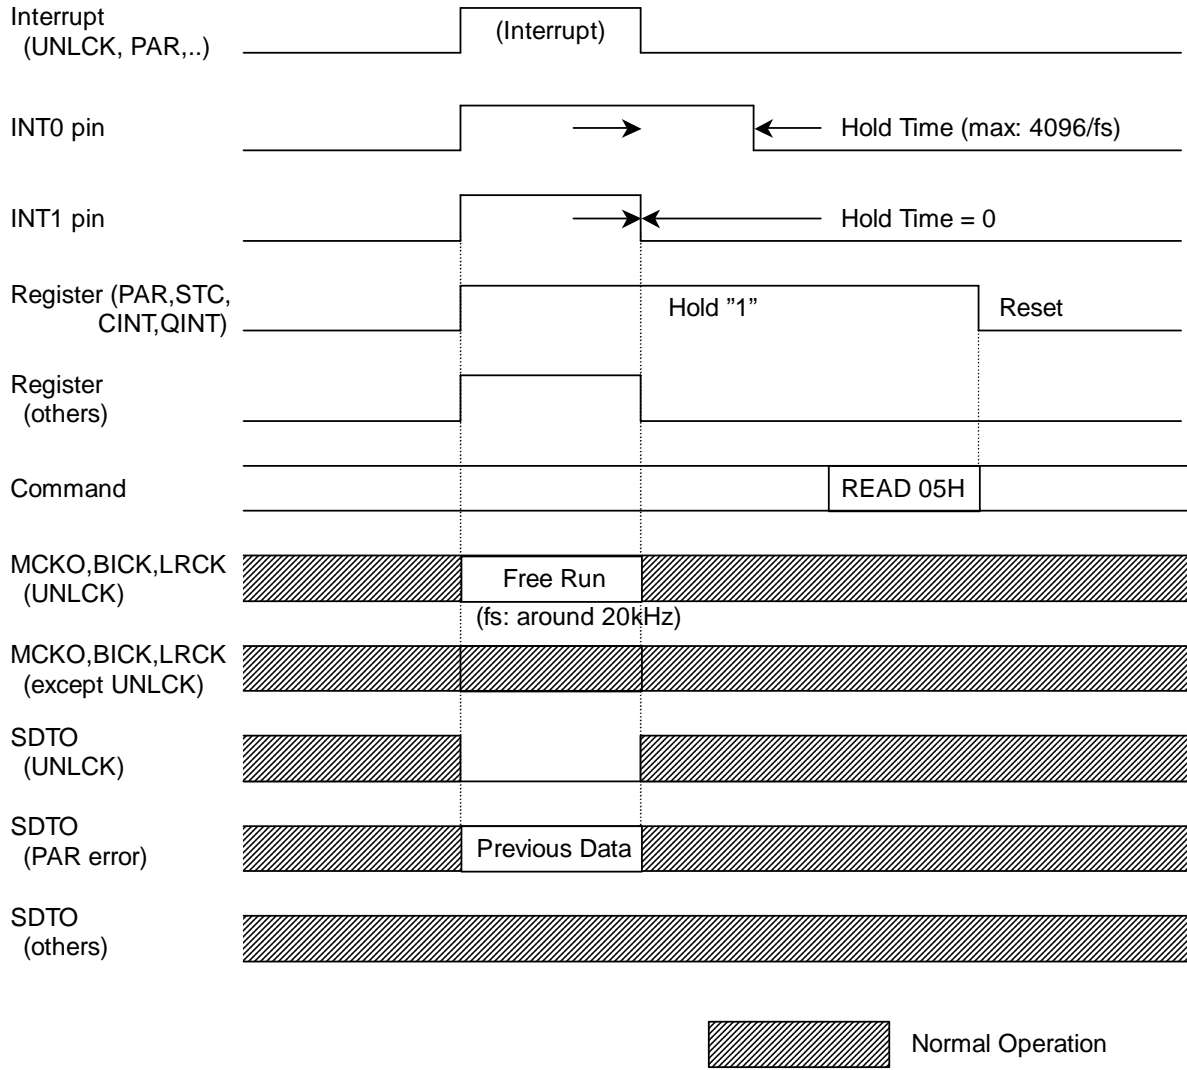

Figure 17. INT1-0 pin timing

Figure 18. Interrupt Handling Sequence Example 1

Figure 19. Interrupt Handling Sequence Example (for Q/CINT)

■ Audio Serial Interface Format

The DIF2-0 bits can select six serial data formats as shown in Table 9. In all formats, the serial data is MSB-first, 2's compliment format. The SDTO is clocked out on the falling edge of BICK and the DAUX is latched on the rising edge of BICK. BICK outputs 64fs clock. When the SDTO format is equal or less than 20 bits (Mode 0-2), LSBs in the sub-frame are truncated. In Modes 3-7, the last four LSBs are auxiliary data (see Figure 20).

When a Parity Error, Biphas Error or Frame Length Error occurs in a sub-frame, the AK4117 continues to output the last normal sub-frame data from SDTO repeatedly until the error is removed. When an Unlock Error occurs, the AK4117 outputs "0" from SDTO. When using the DAUX pin, the data is transformed and output from SDTO. The DAUX pin is used in Clock Operation Modes 1, 3 and in the unlock state of Mode 2. The input data format to DAUX should be left-justified except in Mode 5. In Mode 5, both the input data format of DAUX and the output data format of SDTO are I<sup>2</sup>S.

Figure 20. Bit configuration

Mode	DIF2	DIF1	DIF0	DAUX	SDTO	LRCK
0	0	0	0	24bit, Left justified	16bit, Right justified	H/L
1	0	0	1	24bit, Left justified	18bit, Right justified	H/L
2	0	1	0	24bit, Left justified	20bit, Right justified	H/L
3	0	1	1	24bit, Left justified	24bit, Right justified	H/L
4	1	0	0	24bit, Left justified	24bit, Left justified	H/L
5	1	0	1	24bit, I <sup>2</sup> S	24bit, I <sup>2</sup> S	L/H

■ Serial Control Interface

The internal registers may be either written or read by the 4-wire  $\mu$ P interface pins: CSN, CCLK, CDTI & CDTO. The data on this interface consists of Chip address (2bits, C1-0 are fixed to "00"), Read/Write (1bit), Register address (MSB first, 5bits) and Control data (MSB first, 8bits). Address and data are clocked in on the rising edge of CCLK and data is clocked out on the falling edge. For write operations, data is latched after the 16th rising edge of CCLK, after a high-to-low transition of CSN. For read operations, the CDTO output goes high impedance after a low-to-high transition of CSN. The maximum speed of CCLK is 5MHz. PDN="L" resets the registers to their default values.

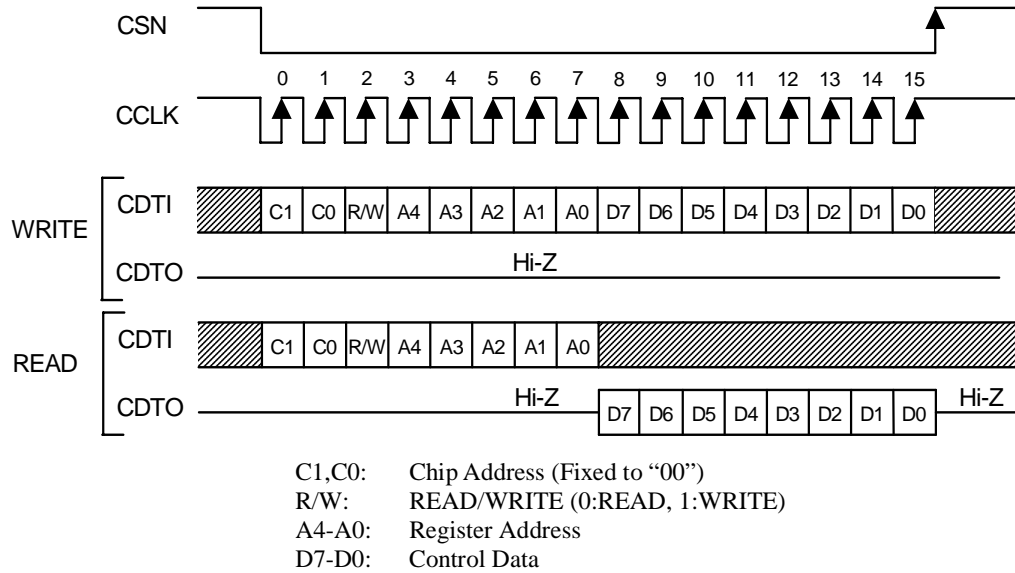

Figure 25. 4-wire Serial Control I/F Timing

## ■ Register Map

Note: When PDN pin goes to “L”, the registers are initialized to their default values.

When RSTN bit goes to “0”, the internal timing is reset and all registers except RSTN, PWN, XTL1-0 and EXCK bits are initialized to their default values.

All data can be written to the registers even if PWN bit is “0”.

## ■ Register Definitions

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
00H	Power Down Control	0	0	0	EXCK	XTL1	XTL0	PWN	RSTN
	R/W	RD	RD	RD	R/W	R/W	R/W	R/W	R/W
	Default	0	0	0	0	0	0	1	1

RSTN: Timing Reset & Register Initialize

0: Reset & Initialize (except RSTN, PWN, XTL1-0 and EXCK bits)

1: Normal Operation (Default)

PWN: Power-Down for Clock Recovery Part

0: Power Down

1: Normal Operation (Default)

XTL1-0: Reference X'tal Frequency Select (Table 4; Default: 00)

EXCK: External Clock Mode Select

0: X'tal mode (Default)

1: External clock mode (Feedback resistor of X'tal oscillator circuit is open.)

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
01H	Clock Control	LP	PCKS1	PCKS0	DIV	XCKS1	XCKS0	CM1	CM0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	Default	1	0	1	0	0	1	0	0

CM1-0: Master Clock Operation Mode Select (Table 1; Default: 00)

XCKS1-0: Master Clock Frequency Select at X'tal Mode (Table 3; Default: 01)

DIV: Master Clock Output Select at X'tal Mode

0: Same frequency as X'tal (Default)

1: Half frequency of X'tal

PCKS1-0: Master Clock Frequency Select at PLL Mode (Table 2; Default: 01)

LP: Low Power Mode Select (Table 2)

0: Normal mode

1: Low power mode (Default)

In low power mode, fs cannot exceed 48kHz.

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
02H	Format Control	IPS	UOUTE	CS12	EFH1	EFH0	DIF2	DIF1	DIF0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	Default	0	0	0	0	1	1	0	0

DIF2-0: Audio Data Format Control (Table 9; Default: 100)

EFH1-0: INT0 Pin Hold Count Select

00: 512 LRCK

01: 1024 LRCK (Default)

10: 2048 LRCK

11: 4096 LRCK

CS12: Channel Status Select

0: Channel 1 (Default)

1: Channel 2

This bit selects which channel status is used to derive C-bit buffers, AUDION, PEM, FS3-0, Pc, Pd and CRC.

UOUTE: U-bit Output Enable

0: Disable (Default)

1: Enable. U-bit is output from UOUT pin.

IPS: Input Recovery Data Select (Table 7)

0: RX0 (Default)

1: RX1

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
03H	INT0 MASK	MULK0	MPAR0	MAUT0	MV0	MAUD0	MSTC0	MCIT0	MQIT0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	Default	0	0	1	1	1	1	1	1

MQIT0: Mask Enable for QINT bit  
 MCIT0: Mask Enable for CINT bit  
 MSTC0: Mask Enable for STC bit  
 MAUD0: Mask Enable for AUDION bit  
 MV0: Mask Enable for V bit  
 MAUT0: Mask Enable for AUTO bit  
 MPAR0: Mask Enable for PAR bit  
 MULK0: Mask Enable for UNLOCK bit

0: Mask disable

1: Mask enable

The factor which mask bit is set to "0" affects INT0 pin operation.

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
04H	INT0 MASK	MULK1	MPAR1	MAUT1	MV1	MAUD1	MSTC1	MCIT1	MQIT1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	Default	1	1	0	0	0	1	1	1

MQIT1: Mask Enable for QINT bit  
 MCIT1: Mask Enable for CINT bit  
 MSTC1: Mask Enable for STC bit  
 MAUD1: Mask Enable for AUDION bit  
 MV1: Mask Enable for V bit  
 MAUT1: Mask Enable for AUTO bit  
 MPAR1: Mask Enable for PAR bit  
 MULK1: Mask Enable for UNLOCK bit

0: Mask disable

1: Mask enable

The factor whose mask bit is set to "0" affects INT1 pin operation.

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
05H	Receiver status 0	UNLCK	PAR	AUTO	V	AUDION	STC	CINT	QINT
	R/W	RD	RD	RD	RD	RD	RD	RD	RD
	Default	0	0	0	0	0	0	0	0

QINT: Q-subcode Buffer Interrupt

0: No change                                    1: Changed

This bit goes to “1” when Q-subcode stored in register addresses 11H to 1AH is updated.

CINT: Channel Status Buffer Interrupt

0: No change                                    1: Changed

This bit goes to “1” when C-bit stored in register addresses 08H to 0CH changes.

STC: Sampling Frequency or Pre-emphasis Information Change Detection

0: No detect                                    1: Detect

This bit goes to “1” when either the FS3-0 or PEM bit changes.

AUDION: Audio Bit Output

0: Audio    1: Non Audio

This bit is made by encoding channel status bits.

V: Validity Bit

0: Valid    1: Invalid

AUTO: Non-PCM or DTS-CD Bit Steam Auto Detection

0: No detect                                    1: Detect

This bit outputs the OR’ed value of NPCM and DTSCD bits.

PAR: Parity Error or Biphas Error Status

0:No Error                                        1:Error

This bit goes to “1” if a parity error or biphas error is detected in the sub-frame.

UNLCK: PLL Lock Status

0: Lock    1: Unlock

QINT, CINT, STC and PAR bits are initialized when 05H is read.

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
06H	Receiver status 1	0	DTSCD	NPCM	PEM	FS3	FS2	FS1	FS0
	R/W	RD	RD	RD	RD	RD	RD	RD	RD
	Default	0	0	0	0	0	0	0	1

FS3-0: Sampling Frequency Detection (Table 5)

PEM: Pre-emphasis Detect

0: OFF

1: ON

This bit is made by encoding the channel status bits.

NPCM: Non-PCM Bit Stream Auto Detection

0: No detect

1: Detect

DTSCD: DTS-CD Bit Stream Auto Detect

0: No detect

1: Detect

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
07H	Receiver status 2	0	0	0	0	0	0	CCRC	QCRC
	R/W	RD	RD	RD	RD	RD	RD	RD	RD
	Default	0	0	0	0	0	0	0	0

QCRC: Cyclic Redundancy Check for Q-subcode

0: No Error

1: Error

CCRC: Cyclic Redundancy Check for Channel Status

0: No Error

1: Error

This bit is enabled only in professional mode and only for the channel selected by the CS12 bit.

Addr	Register Name	D7	D6	D5	D4	D3	D2	D1	D0
08H	RX Channel Status Byte 0	CR7	CR6	CR5	CR4	CR3	CR2	CR1	CR0
09H	RX Channel Status Byte 1	CR15	CR14	CR13	CR12	CR11	CR10	CR9	CR8
0AH	RX Channel Status Byte 2	CR23	CR22	CR21	CR20	CR19	CR18	CR17	CR16
0BH	RX Channel Status Byte 3	CR31	CR30	CR29	CR28	CR27	CR26	CR25	CR24

■ Non-PCM Bitstream timing

1) When Non-PCM preamble does not arrive within 4096 frames,

Figure 27. Timing example 1

2) When Non-PCM bitstream stops (when MULK0=0),

Figure 28. Timing example 2

**SYSTEM DESIGN**

Figure 29 is a system connection diagram. An evaluation board is available which demonstrates application circuits, the optimum layout, power supply arrangements and measurement results.

Figure 29. Typical Connection Diagram

Notes:

- (1) "C" depends on the X'tal. (Typ.10-40pF)
- (2) AVSS and DVSS must be connected the same ground plane.

**PACKAGE**

**24pin VSOP (Unit: mm)**

NOTE: Dimension "\*" does not include mold flash.

■ **Material & Lead finish**

- Package molding compound: Epoxy
- Lead frame material: Cu
- Lead frame surface treatment: Solder (Pb free) plate

**IMPORTANT NOTICE**

- These products and their specifications are subject to change without notice. Before considering any use or application, consult the Asahi Kasei Microsystems Co., Ltd. (AKM) sales office or authorized distributor concerning their current status.
- AKM assumes no liability for infringement of any patent, intellectual property, or other right in the application or use of any information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKM products are neither intended nor authorized for use as critical components in any safety, life support, or other hazard related device or system, and AKM assumes no responsibility relating to any such use, except with the express written consent of the Representative Director of AKM. As used here:
  - (a) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.
  - (b) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.
- It is the responsibility of the buyer or distributor of an AKM product who distributes, disposes of, or otherwise places the product with a third party to notify that party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.
