

FEATURES

Supports Applications Written for
 SoundBlaster* Pro, AdLib/OPL3†
 Win 3.1, Win 95
 Stereo Audio 16-Bit $\Sigma\Delta$ Codec
 MPC Level-2/3 Mixer
 ISA Plug and Play Compatible
 Dual Type F FIFO DMA Support
 MPU-401 Compatible MIDI Port
 Integrated V.34, Modem Analog Front End
 Integrated Enhanced Digital Game Port
 Supports Wavetable Synthesizers
 Two I²S Digital Audio Serial Port Inputs
 Software & Hardware Volume Control
 Integrated FM Compatible Music Synthesizer
 Full-Duplex Capture and Playback
 Operation at Different Sample Rates
 Supports Up to Six Different Sample Rates
 Simultaneously
 Supports Voice Over Data

1 Hz Resolution Programmable Sample
 Rates from 4 kHz to 55.2 kHz
 Bidirectional DSP Serial Port
 Power Management Modes
 Operation from +5 V Supply
 Built-In 24 mA Bus Drivers
 100-Pin PQFP Package

PRODUCT OVERVIEW

The AD1815 SoundComm™ Controller is a single chip Plug and Play audio subsystem for adding 16-bit stereo audio and communications support to personal computers. The AD1815 is compatible with applications written for SoundBlaster Pro and AdLib/OPL3. The AD1815 provides an integrated audio solution for Windows 95, Windows 3.1, DirectSound‡ and multimedia applications. The AD1815 supports telephony and advanced audio applications by providing a V.34 compatible modem analog front end and a serial port linking a companion media pump or DSP to the subsystem.

The AD1815 on-chip Plug and Play hardware provides configuration services for all integrated logical devices.

DIGITAL DECIMATION AND INTERPOLATION FILTERS*

Parameter	Min	Typ	Max	Units
Audio Passband	0		$0.4 \times F_S$	Hz
Audio Passband Ripple			± 0.09	dB
Audio Transition Band	$0.4 \times F_S$		$0.6 \times F_S$	Hz
Audio Stopband	$0.6 \times F_S$		∞	Hz
Audio Stopband Rejection	82			dB
Modem Passband	0		$0.4 \times F_S$	Hz
Modem Passband Ripple			± 0.2	dB
Modem Transition Band	$0.442 \times F_S$		$0.542 \times F_S$	Hz
Modem Stopband	$0.542 \times F_S$		∞	Hz
Modem Stopband Rejection (3 dB Roll Off After Stop Band Edge)	78			dB
Audio Group Delay			$12/F_S$	sec
Modem Group Delay			$18/F_S$	sec
Group Delay Variation Over Passband			0.0	μ s

ANALOG-TO-DIGITAL CONVERTERS

Parameter	Min	Typ	Max	Units
Resolution		16		Bits
Audio Dynamic Range (-60 dB Input THD+N Referenced to Full-Scale, A-Weighted)	80	82		dB
Audio THD+N (Referenced to Full Scale)			0.036	%
		-74	-70	dB
Modem Dynamic Range (-60 dB Input THD+N Referenced to Full Scale, $F_S = 12.8$ kHz)	85	89		dB
Modem THD+N (Referenced to Full Scale, $F_S = 12.8$ kHz)			0.025	%
		-75	-72	dB
Signal-to-Intermodulation Distortion* (CCIF Method)		85		dB
ADC Crosstalk*				
Line Inputs (Input L, Ground R, Read R; Input R, Ground L, Read L)		-90	-80	dB
Line to MIC (Input LINE, Ground and Select MIC, Read ADC)		-90	-80	dB
Line to SYNTH		-90	-80	dB
Line to CD		-90	-80	dB
Line to VID		-90	-80	dB
Gain Error (Full-Scale Span Relative to Nominal Input Voltage)			± 10	%
Interchannel Gain Mismatch (Difference of Gain Errors)			± 1	dB
ADC Offset Error			± 5	mV

DIGITAL-TO-ANALOG CONVERTERS

Parameter	Min	Typ	Max	Units
Resolution		16		Bits
Audio Dynamic Range (-60 dB Input THD+N Referenced to Full Scale, A-Weighted)	80	82		dB
Audio THD+N (Referenced to Full Scale)		-78	0.020	%
Modem Dynamic Range (-60 dB Input THD+N Referenced to Full Scale, 4.2 kHz Analog Output Passband, Differential Output $F_S = 12.8$ kHz)	82	88	-74	dB
Modem THD+N (Referenced to Full Scale, $F_S = 12.8$ kHz, Differential Output 4.2 kHz Analog Passband)			0.008	%
Signal-to-Intermodulation Distortion* (CCIF Method)		-88	-82	dB
Gain Error (Full-Scale Span Relative to Nominal Input Voltage)		90		dB
Interchannel Gain Mismatch (Difference of Gain Errors)			± 10	%
DAC Crosstalk* (Input L, Zero R, Measure R_OUT; Input R, Zero L, Measure L_OUT)			± 0.5	dB
Total Out-of-Band Energy (Measured from $0.6 \times F_S$ to 100 kHz at L-OUT and R_OUT)*			-80	dB
Audible Out-of-Band Energy (Measured from $0.6 \times F_S$ to 20 kHz at L-OUT and R_OUT)*			-45	dB
			-75	dB

MASTER VOLUME & MODEM ATTENUATOR

Parameter	Min	Typ	Max	Units
Master Volume Step Size (0 dB to -22.5 dB)	1.3	1.5	1.7	dB
Master Volume Step Size (-22.5 dB to -46.5 dB)	1.0	1.5	2.0	dB
Master Volume Output Attenuation Range Span	45.5	46.5	47.5	dB
Modem Volume Step Size (0 dB to -31 dB)	0.8	1.0	1.2	dB
Modem Attenuation Range	30	31	32	dB
Mute Attenuation of 0 dB Fundamental*	80			dB

DIGITAL MIX ATTENUATORS

Parameter	Min	Typ	Max	Units
Step Size: I ² S (0), I ² S (1), Music, ISA*		1.505		dB
Digital Mix Attenuation Range Span*		94.8		dB

ANALOG OUTPUT

Parameter	Min	Typ	Max	Units
Full-Scale Output Voltage (at L_OUT and R_OUT)		2.8		V p-p
Full-Scale Output Voltage MDMN_OUT (at MDMN_OUT, MDMP_OUT; Differential)		6.312		V p-p
Output Impedance*			800	Ω
External Load Impedance*	10			k Ω
Output Capacitance*		15		pF
External Load Capacitance			100	pF
V _{REFX} *	2.10	2.25	2.40	V
V _{REFX} Current Drive*		100		μ A
V _{REFX} Output Impedance*		6.5		k Ω
Mute Click (Muted Analog Mixers), Muted Output Minus Unmuted Output at 0 dB*		± 5		mV

AD1815

SYSTEM SPECIFICATIONS*

Parameter	Min	Typ	Max	Units
System Frequency Response Ripple (Line In to Line Out)			1.0	dB
Differential Nonlinearity			±1	LSB
Phase Linearity Deviation			5	Degrees

STATIC DIGITAL SPECIFICATIONS

Parameter	Min	Typ	Max	Units
High Level Input Voltage (V_{IH})	2			V
XTALI	2.4			V
Low Level Input Voltage (V_{IL})			0.8	V
High Level Output Voltage (V_{OH}), $I_{OH} = 8 \text{ mA}^\dagger$	2.4			V
Low Level Output Voltage (V_{OL}), $I_{OL} = 8 \text{ mA}$	0.4			V
Input Leakage Current	-10		+10	μA
Output Leakage Current	-10		+10	μA

POWER SUPPLY

Parameter	Min	Typ	Max	Units
Power Supply Range—Analog	4.75		5.25	V
Power Supply Range—Digital	4.75		5.25	V
Power Supply Current			193	mA
Power Dissipation			965	mW
Analog Supply Current			35	mA
Digital Supply Current			158	mA
Analog Power Supply Current—Powerdown			2	mA
Digital Power Supply Current—Powerdown			23	mA
Analog Power Supply Current—RESET			0.2	mA
Digital Power Supply Current—RESET			10	mA
Power Supply Rejection (100 mV p-p Signal @ 1 kHz)* (At Both Analog and Digital Supply Pins, Both ADCs and DACs)		40		dB

CLOCK SPECIFICATIONS*

Parameter	Min	Typ	Max	Units
Input Clock Frequency		33		MHz
Recommended Clock Duty Cycle	25	50	75	%
Power Up Initialization Time			500	ms

TIMING PARAMETERS (Guaranteed Over Operating Temperature Range)

ABSOLUTE MAXIMUM RATINGS*

Parameter	Min	Max	Units
Power Supplies			
Digital (V_{DD})	-0.3	6.0	V
Analog (V_{CC})	-0.3	6.0	V
Input Current (Except Supply Pins)		± 10.0	mA
Analog Input Voltage (Signal Pins)	-0.3	$V_{CC} + 0.3$	V
Digital Input Voltage (Signal Pins)	-0.3	$V_{DD} + 0.3$	V
Ambient Temperature (Operating)	0	+70	$^{\circ}\text{C}$
Storage Temperature	-65	+150	$^{\circ}\text{C}$

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ENVIRONMENTAL CONDITIONS

Ambient Temperature Rating:

$$T_{\text{AMB}} = T_{\text{CASE}} - (\text{PD} \times \theta_{\text{CA}})$$

T_{CASE} = Case Temperature in $^{\circ}\text{C}$

PD = Power Dissipation in W

θ_{CA} = Thermal Resistance (Case-to-Ambient)

θ_{JA} = Thermal Resistance (Junction-to-Ambient)

θ_{JC} = Thermal Resistance (Junction-to-Case)

Package	θ_{JA}	θ_{JC}	θ_{CA}
PQFP	77°C	7°C	70°C

ORDERING GUIDE

Model	Temperature Range	Package Description	Package Option
AD1815JS	0°C to $+70^{\circ}\text{C}$	100-Lead PQFP	S-100

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD1815 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS

PIN DESCRIPTIONS

Analog Signals

Pin Name	PQFP	I/O	Description
MDM_IN	42	I	Modem Input mono telephony signal from DAA. The input may be sent to the right channel of the ADC if the AD1815 is in modem mode; gained or attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left and right line out (L_OUT and R_OUT).
MIC	41	I	Microphone Input. The MIC input may be either line-level or -20 dB from line-level (the difference being made up through a software controlled 20 dB gain block). The mono MIC input may be sent to the left and right channel of the ADC for conversion, or gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left and right line out (L_OUT and R_OUT), before the Master Volume stage.
L_LINE	40	I	Left Line-Level Input. The left line-level input may be: sent to the left channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left line out (L_OUT).
R_LINE	39	I	Right Line-Level Input. The right line-level input may be: sent to the right channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with right line out (R_OUT).
L_SYNTH	46	I	Left Synthesizer Input. The left MIDI upgrade line-level input may be: sent to the left channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left line out (L_OUT).
R_SYNTH	45	I	Right Synthesizer Input. The right MIDI upgrade line-level input may be: sent to the right channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with right line out (R_OUT).
L_CD	44	I	Left CD Line-Level Input. The left CD line-level input may be: sent to the left channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left line out (L_OUT).
R_CD	43	I	Right CD Line-Level Input. The right CD line-level input may be: sent to the right channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with right line out (R_OUT).
L_VID	48	I	Left Video Input. The left audio track for a video line-level input may be: sent to the left channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with left line out (L_OUT).
R_VID	47	I	Right Video Input. The right audio track for a video line-level input may be: sent to the right channel of the ADC; gained/attenuated from +12 dB to -34.5 dB in 1.5 dB steps and then summed with right line out (R_OUT).
L_OUT	55	O	Left Output. Left channel line-level post-mixed output. The final stage passes through the Master Volume block and may be attenuated 0 dB to -45 dB in 1.5 dB steps.
R_OUT	54	O	Right Output. Right channel line-level post-mixed output. The final stage passes through the Master Volume block and may be attenuated 0 dB to -45 dB in 1.5 dB steps.
MDMN_OUT	57	O	Differential Modem Output Negative.
MDMP_OUT	56	O	Differential Modem Output Positive.
MONO_IN	53	I	Mono Line-Level Input.

AD1815

Parallel Interface (All Outputs are 24 mA Drivers)

Pin Name	PQFP	I/O	Description
PC_D[7:0]	84-87, 90-93	I/O	Bidirectional ISA Bus PC Data, 24 mA drive. Connects the AD1815 to the low byte data on the bus.
IRQ(x)	77-82	O	Host Interrupt Request, 24 mA drive. IRQ(5), IRQ(7), IRQ(9), IRQ(11), IRQ(12), IRQ(15). Active HI signals indicating a pending interrupt. These signals are always edge triggered, not level triggered.
DRQ(x)	74-76	O	DMA Request, 24 mA drive. DRQ(0), DRQ(1), DRQ(3). Active HI signals indicating a request for DMA bus operation.
PC_A[11:0]	6-17	I	ISA Bus PC Address. Connects the AD1815 to the ISA bus address lines.
AEN	18	I	Address Enable. Low signal indicates a PIO transfer.
$\overline{\text{DACK}}$ (x)	61-63	I	DMA Acknowledge. DACK(0), DACK(1), DACK(3). Active LO signal indicating that a DMA operation can begin.
$\overline{\text{IOR}}$	20	I	I/O Read. Active LO signal indicates a read operation.
$\overline{\text{IOW}}$	19	I	I/O Write. Active HI signal indicates a write operation.
RESET	58	I	Reset. Active HI.

Game Port

Pin Name	PQFP	I/O	Description
A_1	23	I	Game Port A, Button #1.
A_2	24	I	Game Port A, Button #2.
A_X	28	I	Game Port A, X-Axis.
A_Y	29	I	Game Port A, Y-Axis.
B_1	25	I	Game Port B, Button #1.
B_2	26	I	Game Port B, Button #2.
B_X	30	I	Game Port B, X-Axis.
B_Y	31	I	Game Port B, Y-Axis.

MIDI Interface Signal (24 mA Drivers)

Pin Name	PQFP	I/O	Description
MIDI_IN	68	I	RXD MIDI Input. This pin is typically connected to Pin 15 of the game port connector via an optoisolator.
MIDI_OUT	69	O	TXD MIDI Output. This pin is typically connected to Pin 12 of the game port connector to form a 5 mA current loop.

Serial Ports (8 mA Drivers)

Pin Name	PQFP	I/O	Description
I ² S0_BCLK	5	I	I ² S (0) Bit Clock.
I ² S0_LRCLK	4	I	I ² S (0) Left/Right Clock.
I ² S0_DATA	3	I	I ² S (0) Serial Data Input.
I ² S1_BCLK	2	I	I ² S (1) Bit Clock.
I ² S1_LRCLK	1	I	I ² S (1) Left/Right Clock.
I ² S1_DATA	100	I	I ² S (1) Serial Data Input.
SPORT_SDI	99	I	Serial Port Digital Serial Input.
SPORT_SCLK	96	O	Serial Port Serial Clock.
SPORT_SDFS	97	O	Serial Port Serial Data Frame Synchronization.
SPORT_SDO	98	O	Serial Port Serial Data Output.

Miscellaneous Analog Pins

Pin Name	PQFP	I/O	Description
V _{REF_X}	49	O	Voltage Reference. Nominal 2.25 volt reference available for dc-coupling and level-shifting. V _{REF_X} should not be used to sink or source signal current.
V _{REF}	50	I	Voltage Reference Filter. Voltage reference filter point for external bypassing only.
L_FILT	36	I	Left Channel Filter. Requires a 1.0 µF to analog ground for proper operation.
R_FILT	35	I	Right Channel Filter. Requires a 1.0 µF to analog ground for proper operation.
L_AAFILT	38	I	Left Channel Antialias Filter. This pin requires a 270 pF NPO capacitor to analog ground for proper operation.
R_AAFILT	37	I	Right Channel Antialias Filter. This pin requires a 270 pF NPO capacitor to analog ground for proper operation.

Crystal Pin

Pin Name	PQFP	I/O	Description
XTALO	66	O	33 MHz Crystal Output. If no Crystal is present leave XTALO unconnected.
XTALI	65	I	33 MHz Clock. When using a crystal as a clock source, the crystal should be connected between the XTALI and XTALO pins. Clock input may be driven into XTALI in place of a crystal. When using an external clock, V _{IH} must be 2.4 V rather than the V _{IH} of 2.0 V specified for all other digital inputs.

AD1815

Hardware Volume Pins

Pin Name	PQFP	I/O	Description
$\overline{\text{VOL_DWN}}$	59	I	Master Volume Down. Modifies output level on pins L_OUT and R_OUT. Contains a 10 k Ω internal pull-up resistor. When asserted LO, decreases Master Volume by 1.5 dB/sec. Must be asserted at least 25 ms to be recognized. When asserted simultaneously with VOL_UP, output is muted. Output level modification reflected in indirect register 0 \times 29.
$\overline{\text{VOL_UP}}$	60	I	Master Volume Up. Modifies output level on pins L_OUT and R_OUT. Contains a 10 k Ω internal pull-up resistor. When asserted LO, increases Master Volume by 1.5 dB/sec. Must be asserted at least 25 ms to be recognized. When asserted simultaneously with VOL_UP, output is muted. Output level modification reflected in indirect register 0 \times 29.

Muxed Control Pins

Pin Name	PQFP	I/O	Description
XCTL0	70	O	External Control 0. The state of this pin (TTL HI or LO) is reflected in codec indexed register. This pin is an open drain driver.
PCLKO	70	O	Programmable Clock Output. This pin can be programmed to generate an output clock equal to F_S , $8 \times F_S$, $16 \times F_S$, $32 \times F_S$, $64 \times F_S$, $128 \times F_S$ or $256 \times F_S$. MPEG decoders typically require a master clock of $256 \times F_S$ for audio synchronization.
XCTL1	71	O	External Control 1. The state of this pin (TTL HI or LO) is reflected in codec indexed register. Open drain, 8 mA active 0.5 mA internal pull-up resistor.
RING	71	I	Ring Indicator. Used to accept the ring indicator flag from the DAA.

Power Supplies

Pin Name	PQFP	I/O	Description
V _{CC}	33, 52	I	Analog Supply Voltage (+5 V).
G _{NDA}	34, 51	I	Analog Ground.
V _{DD}	21, 64, 73, 88, 94	I	Digital Supply Voltage (+5 V).
G _{NDD}	22, 67, 72, 83, 89, 95	I	Digital Ground.
V _{DDG}	32	I	Game Port Digital Supply Voltage (+5 V).
G _{NDG}	27	I	Game Port Digital Ground.

HOST INTERFACE

The AD1815 contains all necessary ISA bus interface logic on chip. This logic includes address decoding for all onboard resources, control and signal interpretation, DMA selection and control logic, IRQ selection and control logic, and all interface configuration logic.

The AD1815 supports a Type "F" DMA request/grant architecture for transferring data with the ISA bus through the 8-bit interface. The AD1815 also supports DACK preemption. Programmed I/O (PIO) mode is also supported for control register accesses and for applications lacking DMA control. The AD1815 includes dual DMA count registers for full-duplex operation enabling simultaneous capture and playback on separate DMA channels.

Codec Functional Description

The AD1815's full-duplex stereo codec supports business audio and multimedia applications. The codec includes stereo audio converters, complete on-chip filtering, MPC Level-2 and Level-3 compliant analog mixing, programmable gain and attenuation, a variable sample rate converter, extensive digital mixing, and FIFOs buffering the Plug and Play ISA bus interface.

Analog Inputs

The codec contains a stereo pair of $\Sigma\Delta$ analog-to-digital converters (ADC). Inputs to the ADC can be selected from the following analog signals: mono modem or telephony (MDM_IN), mono microphone (MIC), stereo line (LINE), external stereo synthesizer (SYNTH), stereo CD ROM (CD), stereo audio from a video source (VID), and post-mixed stereo or mono line output (OUT).

Analog Mixing

MDM_IN, MIC, MONO_IN, LINE, SYNTH, CD, and VID can be mixed in the analog domain with the stereo line OUT from the $\Sigma\Delta$ digital-to-analog converters (DAC). Each channel of the stereo analog inputs can be independently gained or attenuated from +12 dB to -34.5 dB in 1.5 dB steps. The summing path for the mono inputs (MDM_IN, MIC, and MONO_IN to line OUT) duplicates mono channel data on both the left and right line OUT which can also be gained or attenuated from +12 dB to -34.5 dB in 1.5 dB steps for MDM_IN and MIC, and +0 dB to -45.5 dB in 3 dB steps for MONO_IN. The left and right mono summing signals are always identical being gained or attenuated equally.

Analog-to-Digital Datapath

The selector sends left and right channel information to the programmable gain amplifier (PGA). The PGA following the selector allows independent gain for each channel entering the ADC from 0 dB to 22.5 dB in 1.5 dB steps.

When the modem converters are enabled, each channel of the ADC is independent and can process left and right channel data at different sample rates. The right channel of the ADC samples modem information received from the DAA in the programmable range between 4 kHz and 13.8 kHz. All programmed sample rates have a resolution of 1 Hz. The AD1815 also supports the following irrational V.34 sample rates: $8/7 \times 7,200$ Hz, $8/7 \times 9,000$ Hz, and $8/7 \times 12,000$ Hz.

For supporting time correlated I/O echo cancellation, the ADC is capable of sampling microphone data on the left channel and the mono summation of left and right OUT on the right channel.

The codec can operate either in global stereo mode or in a global mono mode with left channel inputs appearing at both channels of the 16-bit $\Sigma\Delta$ converters. Data can be sampled at the programmed sampling frequency (from 4 kHz to 55.2 kHz with 1 Hz resolution).

Digital Mixing & Sample Rates

The audio ADC sample rate and the audio DAC sample rates are completely independent. The AD1815 includes a variable sample rate converter that lets the codec instantaneously change and process sample rates from 4 kHz to 55.2 kHz with a resolution of 1 Hz. The in-band integrated noise and distortion artifacts introduced by rate conversions are below -90 dB. When the modem converters are enabled, the right channel of the ADC and the modem DAC convert modem data at the same sample rate.

Up to four channels of digital data can be summed together and presented to the stereo DAC for conversion. Each digital channel pair can contain information encoded at a different sample rate. For example, 8 kHz .wav data received from the ISA interface, 48 kHz MPEG audio data received from I²S(0), digital 44.1 kHz CD data received from I²S(1), and internally generated 22.05 kHz music data may be summed together and then converted by the DACs.

Digital-to-Analog Datapath

The internally generated music synthesizer data, PCM data received from the ISA interface, data received from the I²S(0) port, and data received from the I²S(1) port, and the DSP serial port passes through an attenuation mute stage. The attenuator allows independent control over each digital channel which can be attenuated from 0 dB to -94.5 dB in 1.5 dB steps before being summed together and passed to the DAC or the channel may be muted entirely.

Analog Outputs

The analog output of the DAC can be summed with any of the analog input signals. The summed analog signal enters the Master Volume stage where each channel of the line OUT can be attenuated from 0 dB to -46.5 dB in 1.5 dB steps or muted.

Digital Data Types

The codec can process 16-bit twos-complement PCM linear digital data, 8-bit unsigned magnitude PCM linear data, and 8-bit μ -law or A-law companded digital data as specified in the control registers. The AD1815 also supports ADPCM encoded in the Creative SoundBlaster ADPCM formats.

Host-Based Echo Cancellation Support

The AD1815 supports time correlated I/O data format by presenting MIC data on the left channel of the ADC and the mono summation of left and right OUT on the right channel. The ADC sample rates are independent of the DAC sample rate allowing the AD1815 to support ADC time correlated I/O data at 8 kHz and DAC data at any other sample rate in the range of 4 kHz to 55.2 kHz simultaneously.

AD1815

Telephony Modem Support

AD1815 contains a V.34 capable analog front end for supporting host-based and data pump modems. The modem DAC typical dynamic range is 90 dB over a 4.2 kHz analog output passband. In modem mode, the right channel of the ADC and a dedicated DAC convert modem data at the same sample rate in the range between 4 kHz and 13.8 kHz. All programmed sample rates have a 1 Hz resolution. The AD1815 also supports the following irrational V.34 sample rates:

$8/7 \times 7,200$ Hz, $8/7 \times 9,000$ Hz, and $8/7 \times 12,000$ Hz

For native modem applications, all modem processing is handled by the host and all data is transferred by PIO over the ISA interface through a 4 deep FIFO.

For modem applications using a dedicated data pump, a bi-directional DSP serial port interfaces directly to the data pump.

WSS & SoundBlaster Compatibility

Windows Sound System software audio compatibility is built into the AD1815.

SoundBlaster emulation is provided through the SoundBlaster register set and the internal music synthesizer. SoundBlaster Pro version 2.01 functions are supported including record and Creative SoundBlaster ADPCM.

Virtually all applications developed for SoundBlaster, Windows Sound System, AdLib, and MIDI MPU-401 platforms run on the AD1815 SoundComm Controller. Follow the same development process for the controller as you would use for these other devices. This section provides information on related development kits, hardware/software specifications, and reference texts.

As the AD1815 contains SoundBlaster (compatible) and Windows Sound System logical devices. You may find the following related development kits useful when developing AD1815 applications.

Developer Kit for SoundBlaster Series, 2nd ed. © 1993, Creative Labs, Inc., 1901 McCarthy Blvd., Milpitas, CA 95035

Multimedia PC Capabilities

The AD1815 is MPC-2 and MPC-3 compliant. This compliance is achieved through the AD1815's flexible mixer and the embedded chip resources.

Music Synthesis

The AD1815 includes an embedded music synthesizer that emulates industry standard OPL3 FM synthesizer chips and deliver 20 voice polyphony. The internal synthesizer generates digital music data at 22.05 kHz and is summed into the DACs digital data stream prior to conversion. To sum synthesizer data with the ADC output, the ADC must be programmed for a 22.05 kHz sample rate.

The synthesizer is a hardware implementation of Eusynth-1 + code that was developed by Euphonics, a research and development company that specializes in audio processing and electronic music synthesis.

Wavetable MIDI Inputs

The AD1815 has a dedicated analog input for receiving an analog wavetable synthesizer output. Alternatively, a wavetable synthesizer's I²S formatted digital output can be directly connected to one of the AD1815's I²S serial ports. Digital wavetable data from the AD1815's I²S port can be summed with other digital data streams being handled by the AD1815 and then sent to the 16-bit $\Sigma\Delta$ DAC.

MIDI

The primary interface for communicating MIDI data to and from the host PC is the compatible MPU-401 interface that operates in UART mode. The MPU-401 interface has two built-in FIFOs: a 64 byte receive FIFO and a 16 byte transmit FIFO.

Game Port

An IBM-compatible game port interface is provided on chip. The game port supports up to two joysticks via a 15-pin D-sub connector. Joystick registers supporting the Microsoft Direct Input standard are included as part of the register map. The AD1815 may be programmed to automatically sample the game port and save the value in the Joystick Position Data Register. When enabled, this feature saves up to 10% CPU MIPS by off-loading the host from constantly polling the joystick port.

Volume Control

The registers that control the Master Volume output stage are accessible through the parallel port. Master Volume output can also be controlled through a 2-pin hardware interface. One pin is used to increase the gain, the other pin attenuates the output, and both pins together mute the output entirely. Once muted, any further activity of these pins will unmute the AD1815's output.

Plug & Play

The AD1815 is fully Plug and Play configurable. For motherboard applications, the built-in Plug and Play protocol can be disabled with a software key providing a back door for the BIOS to configure the AD1815's logical devices. For information on the Plug & Play mode configuration process, see the *Plug & Play ISA Specification Version 1.0a (May 5, 1994)*. All the AD1815's logical devices comply with Plug & Play resource definitions described in the specification.

AD1815

SERIAL INTERFACES

I²S Serial Ports

The two I²S serial ports on the AD1815 accept serial data in the following formats: Right-Justified, I²S-Justified, and Left-Justified.

The following figure shows the right-justified mode. LRCLK is HI for the left channel, and LO for the right channel. Data is valid on the rising edge of the BCLK. The MSB is delayed 16-bit clock periods from an LRCLK transition, so that when there are 64 BCLK periods per LRCLK period, the LSB of the data will be right-justified to the next LRCLK transition.

Figure 9. Serial Interface Right-Justified Mode

The following figure shows the I²S-justified mode. LRCLK is LO for the left channel, and HI for the right channel. Data is valid on the rising edge of BCLK. The MSB is left-justified to an LRCLK transition, but with a single BCLK period delay.

Figure 10. Serial Interface I²S-Justified Mode

The following figure shows the left-justified mode. LRCLK is HI for the left channel, and LO for the right channel. Data is valid on the rising edge of BCLK. The MSB is left-justified to an LRCLK transition, with no MSB delay.

Figure 11. Serial Interface Left-Justified Mode

Bidirectional DSP Serial Interface

The AD1815 SoundComm Controller transmits and receives both data and control/status information through its DSP serial interface port (SPORT). The AD1815 is always the bus master and supplies the frame sync and the serial clock. The AD1815 has four pins assigned to the SPORT: SDI, SDO, SDFS, and SCLK. The SPORT has two operating modes: monitor and intercept. The SPORT always monitors the various data streams being processed by the AD1815. In intercept mode, any of the digital data streams can be manipulated by the DSP before reaching the final ADC or DAC stages.

The SDI and SDO pins handle the serial data input and output of the AD1815. Communication in and out of the AD1815 requires that bits of data are transmitted after a rising edge of SCLK, and sampled on the falling edge of SCLK. The SCLK frequency is always 11 MHz (or 1/3 or XTALI).

When the modem channel is not enabled, these time slots are mapped as shown in Table I.

Table I. Modem Disabled Time Slot Map

Time Slot	SDI Pin	SDO Pin
0	Control Word Input	Status Word Output
1	Control Register Data Input	Control Register Data Output
2	* SS/SB ADC Right Input (to ISA)	SS/SB ADC Right Output (from Codec)
3	* SS/SB ADC Left Input (to ISA)	SS/SB ADC Left Output (from Codec)
4	* SS/SB DAC Right Input (to Codec)	SS/SB DAC Right Output (from ISA)
5	* SS/SB DAC Left Input (to Codec)	SS/SB DAC Left Output (from ISA)
6	* FM DAC Right Input (to Codec)	FM DAC Right Output (from FM Synth Block)
7	* FM DAC Left Input (to Codec)	FM DAC Left Output (from FM Synth Block)
8	* I ² S 1 DAC Right Input (to Codec)	I ² S 1 DAC Right Output (from I ² S Port 1)
9	* I ² S 1 DAC Left Input (to Codec)	I ² S 1 DAC Left Output (from I ² S Port 1)
10	* I ² S 0 DAC Right Input (to Codec)	I ² S 0 DAC Right Output (from I ² S Port 0)
11	* I ² S 0 DAC Left Input (to Codec)	I ² S 0 DAC Left Output (from I ² S Port 0)

*This data is ignored by the AD1815 unless the channel pair is in intercept mode (see below).

SS - Sound System Mode
SB = Sound Blaster Mode

When the modem channel is enabled (DSP modem mode), time slots are mapped as above except for time Slot 2, which is as follows:

2	Modem DAC Input (to Codec)	Modem ADC Output (from Codec)
---	----------------------------	-------------------------------

When the modem channel is enabled, stereo SB or SS capture is not possible and SB and SS fall back to mono capture. The right capture channel then gets the left channel capture data.

At startup (after pin reset), there are exactly 12 time slots per frame. The frame rate will be 57,291 and 2/3 Hz (11 MHz sclck/ (16 bits × 12 slots)). Interfacing with an Analog Devices 21xx family DSP can be achieved by putting the ADSP-21xx in 24 slot per frame mode, where the first 12 and second 12 slots in the ADSP-21xx frame are identical.

The frame rate can be changed from its default by a write to the DFS(2:0) bits in register 33. Rate choices are: Maximum (57,291 and 2/3 Hz default), Modem rate, SS capture rate, SS playback rate, FM rate, I²S Port (1) rate, or I²S Port (0) rate. When the frame rate is less than 57,261 and 2/3 Hz, extra SCLK periods are added to fill up the time. The number of SCLK periods added will vary somewhat from frame to frame.

Similar to the AD1843, Valid out, Request in, and Valid in bits located in the control and status words are used to control sample data flow. If a channel's sample rate is equal to the frame rate, these bits can be ignored since they will predictably always be 1s.

By default, the DSP serial port only allows codec sample data I/O to be monitored. Intercept modes must be enabled to make substitutions in sample data flow to and from the codec. There are five bits in SS register 33 which enable intercept mode for SS capture, SS playback, FM playback, I²S Port (1) playback, and I²S Port (0) playback.

Control Word Input (Slot 0 SDI)

15	14	13	12	11	10	9	8
FCLR	RES	MODVI	SSCVI	SSPVI	FMVI	IS1VI	IS0VI
7	6	5	4	3	2	1	0
ALIVE	R/W	IA[5:0]					

IA [5:0] Indirect Register Address. Sound System Indirect Register Address defines the address of indirect registers shown in Table VI.

R/W Read/Write request. Either a read from or a write to a SS indirect register occurs every frame. Setting this bit initiates a SS indirect register read while clearing this bit initiates a SS indirect register write.

ALIVE DSP port alive bit. When set, this bit indicates to the powerdown timer that the DSP port is active. When cleared, this bit indicates that the DSP port is inactive.

IS0VI I²S Port 0 Substitution Data Input Valid Flag. This bit is ignored if: (1) Intercept mode is not enabled for the I²S port 0 channel pair, or (2) The AD1815 did not request data from the I²S port 0 channel pair in the previous frame. Otherwise, setting this bit indicates that slots 10 and 11 contain valid right and left I²S Port 0 substitution data. When this bit is cleared, data in slots 10 and 11 is ignored.

IS1VI I²S Port 1 Substitution Data Input Valid Flag. This bit is ignored if: (1) Intercept mode is not enabled for I²S port 1 channel pair, or (2) The AD1815 did not request data from the I²S port channel pair in the previous frame. Otherwise, setting this bit indicates that Slots 8 and 9 contain valid right and left I²S Port 1 substitution data. When this bit is cleared, data in slots 8 and 9 is ignored.

AD1815

- FMVI** FM Synthesis Substitution Data Input Valid Flag. This bit is ignored if: (1) Intercept mode is not enabled for the FM synthesis channel pair, or (2) The AD1815 did not request data from the FM synthesis channel pair in the previous frame (see the FMRQ Bit 9 in the status word output). Otherwise, setting this bit to 1 indicates that slots 6 and 7 contain valid right and left FM synthesis channel substitution data. When this bit is reset to 0, data in slots 6 and 7 is ignored.
- SSPVI** SS/SB Playback Substitution Data Input Valid Flag. This bit is ignored if: (1) Intercept mode is not enabled for SS/SB playback, or (2) The AD1815 did not request data for SS/SB playback in the previous frame (see the SSPRQ bit in the Status Word Output). Otherwise, setting this bit indicates that Slots 4 and 5 contain valid right and left SS/SB playback substitution data. If in “capture rate equal to playback rate” mode, setting this bit also indicates that valid capture substitution data is being sent to the AD1815. If not in modem mode, right and left channel capture substitution data is accepted in Slots 2 and 3 respectively. If in modem mode, only mono capture substitution data is accepted in slots 2 and 3. When this bit is cleared, data in all slots controlled by this bit, as defined above, is ignored.
- SSCVI** SS/SB Capture Substitution Data Input Valid Flag. This bit is ignored if: (1) Intercept mode is not enabled for SS/SB capture, or (2) The AD1815 did not request data for SS/SB capture in the previous frame (see the SSCRQ bit in the Status Word Output). Otherwise, setting this bit indicates that valid SS/SB capture substitution data is being sent to the AD1815. If not in modem mode, or DSP port or ISA bus based, right and left channel capture data is accepted in Slots 2 and 3 respectively. If in modem mode, only mono capture substitution data is accepted in Slot 3, because Slot 2, which is mapped to the right capture channel, is being used for modem. This mono data will, however, be sent to both left and right ISA SS/SB capture channels. When this bit is cleared, data in Slots 3 and 2 is ignored.
- MODVI** Modem Input Valid flag. This bit is ignored if: (1) The AD1815 is in DSP modem mode, or (2) If the AD1815 did not request data for the modem in the previous frame (see the MODRQ bit in the Status Word Output). When in DSP modem mode, setting this bit indicates that Slot 2 contains valid modem data to be transmitted. When this bit is cleared, data in Slot 2 is ignored.
- RES** Reserved: To insure future compatibility write “0” to all reserved bits.
- FCLR** DSP Port Clear Status Flag. When you set this bit, (write 1), the PNPR and PDN flag bits in the status word (Bits 15 and 14 of slots 0 SDO) are cleared. When you clear this bit, (writing a 0), it has no effect on PNPR and PDN and preserves them in the previous states.

Status Word Output (Slot 0 SDO)

15	14	13	12	11	10	9	8
PDN	PNPR	MODVO	SSCVO	SSPVO	FMVO	IS1VO	IS0VO
7	6	5	4	3	2	1	0
MB1	MB0	MODRQ	SSCRQ	SSPRQ	FMRQ	IS1RQ	IS0RQ

- IS0RQ** I²S Port (0) Input Request Flag. This bit is set if intercept mode is enabled for I²S Port (0) and its four-word stereo input buffer is not full.
- IS1RQ** I²S Port (1) Input Request Flag. This bit is set if intercept mode is enabled for I²S Port (1) and its four-word stereo input buffer is not full.
- FMRQ** FM Synthesis Input Request Flag. This bit is set if intercept mode is enabled for FM synthesis and its four-word stereo input buffer is not full.
- SSPRQ** SS/SB Capture Input Request Flag. This bit is set if intercept mode is enabled for SS/SB playback and its four-word stereo input buffer is not full.
- SSCRQ** SS/SB Capture Input Request Flag. This bit is set if intercept mode is enabled for SS/SB capture and its four-word stereo input buffer is not full.
- MODRQ** Modem Input Request Flag. This bit is set if the modem is enabled and its four-word stereo input buffer is not full.
- MB0** Mailbox 0 Status Flag. This bit is set if the most recent action to SS indirect register 42 (DSP port Mail Box 1) was a write, and is cleared if the most recent action was a read. The status of this bit is also reflected in SS indirect register 33. It may be used as a handshake bit to facilitate communication between a DSP on the DSP port and a host CPU on the ISA bus.
- MB1** Mailbox 1 Status Flag. This bit is set if the most recent action to SS indirect register 43 (DSP port Mail Box 1) was a write and is cleared if the most recent action was a read. The status of this bit is also reflected in SS indirect register 33. It may be used as a handshake bit to facilitate communication between a DSP on the DSP port and a host CPU on the ISA bus.
- IS0VO** I²S Port 0 Valid Out. This bit is set if Slots 10 and 11 contain valid right and left I²S Port 0 data.
- IS1V1** I²S Port 1 Valid Out. This bit is set if Slots 8 and 9 contain valid right and left I²S Port 1 data.

- FMVO FM Synthesis Valid Out. This bit is set if Slots 6 and 7 contain valid left and right FM synthesis data.
- SSPVO SS/SB Playback Valid Out. This bit is set if Slots 4 and 5 contain valid right and left SS/SB playback data.
- SSCVO SS/SB Capture Valid Out. This bit is set if valid SS/SB capture data is being transmitted. If not in a modem mode, Slots 2 and 3 will contain valid right and left SS/SB capture data. If in modem mode, only Slot 3 will contain valid left SS/SB capture data as Slot 2 and the ADC right channel are used by the modem.
- MODVO Modem Valid Out. This bit is set if Slot 2 contains valid modem capture data.
- PNPR Plug and Play Reset flag. This bit is set by an AD1815 reset (RESETB pin asserted LOW), or by a Plug and Play reset command. This bit is cleared by the assertion of the FCLR bit in the control word. While this bit is set, all attempts to write a SS indirect register via the DSP port will be ignored and fail. This is to insure that Plug and Play resets are immediately applied to the application running on the DSP, without requiring them to continuously poll the Plug and Play reset status bit. During the frame that this bit is cleared (by asserting FCLR), an attempt to write a SS indirect register will succeed. If the FCLR bit is asserted continuously, writes to indirect registers via the DSP port will always be enabled. A Plug and Play reset command will set this PNPR bit HIGH during at least one frame.
- PDN Powerdown flag. This bit is set by an AD1815 reset (RESETB pin asserted LOW), or by an AD1815 powerdown. Before an AD1815 powerdown sequence shuts down the DSP port, at least one frame will be sent with this bit set. This bit can be cleared by the assertion of the FCLR (DSP port status clear) bit in the control word, providing the AD1815 is no longer in powerdown.

The SDFS pin is used for the serial interface frame synchronization. New frames are marked by a one SCLK duration HI pulse driven out on SDFS one serial clock period before the frame begins. Upon initializing, there are exactly 12 time slots per frame, and 16 bits per time slot. The frame rate is 57,291 and 2/3 Hz (11 MHz SCLK / (16 bits * 12 slots)). The frame rate can also be changed from the default value by reprogramming the rate in registers. The frame rate can run at the default rate or programmed to match the modem sample rate, ADC capture rate, DAC playback rate, music sample rate, I²S(1) sample rate, or I²S(0) sample rate. When the frame rate is not equivalent to the sample rate, Valid Out, Request In, and Valid In bits are used to control the sample data flow. When the frame rate is equivalent to the sample rate, Valid and Request bits can be ignored.

Figure 12. DSP Serial Interface (Default Frame Rate)

Figure 13. DSP Serial Interface (User Programmed Frame Rate)

AD1815

The following figure illustrates the flexibility of the DSP Serial Port interface. This port can monitor or intercept any of the digital streams managed by the AD1815. Any ADC or DAC data stream can be intercepted by the port, shipped to an external DSP or ASIC, manipulated, and returned to any DAC summing path or the ADC.

Figure 14. DSP Serial Port

ISA INTERFACE

AD1815 Chip Registers

Table II, Chip Register Diagram, details the AD1815 direct register set available from the ISA Bus. The PC I/O addressable ports must be configured using the Plug and Play Resources prior to any accesses by the host.

Table II. Chip Register Diagram

Register Type-Register Name	Register PC I/O Address
<i>Plug and Play</i> ADDRESS WRITE_DATA READ_DATA	0x279 0xA79 Relocatable in Range 0x203 - 0x3FF

AD1815 Plug and Play Device Configuration Registers

The AD1815 may be configured according to the Intel/Microsoft Plug and Play Specification using the internal ROM. Alternatively, the PnP configuration sequence may be bypassed using the “Alternate Key Sequence” described in Appendix A.

The operating system configures/reconfigures AD1815 Plug and Play Logical Devices after system boot. There are no “boot-devices” among the Plug and Play Logical Devices in the AD1815. Non-Plug and Play BIOS systems configure the AD1815’s Logical Devices after boot using drivers. Depending on BIOS implementations, Plug and Play BIOS systems may configure the AD1815’s Logical Devices before POST or after Boot. See the *Plug and Play ISA Specification Version 1.0a* for more information on configuration control. To complete this configuration, the system reads resource data from the AD1815’s on-chip resource ROM and from any other Plug and Play cards in the system, then arbitrates the configuration of system resources with a heuristic algorithm. The algorithm maximizes the number of *active* devices and the *acceptability* of their configurations.

The system considers all Plug and Play logical device resource data at the same time and makes a conflict-free assignment of resources to the devices. If the system cannot assign a conflict-free resource to a device, the system does not configure or activate the device. All configured devices are activated.

The system’s Plug and Play support selects all necessary drivers, starts them, and maintains a list of system resources allocated to each logical device. Optionally, you can reassign system resources at runtime with a Plug and Play Resource Manager. The custom setup created using the manager can be saved and used automatically on subsequent system boots.

Plug and Play Device IDs (embedded in the logical device’s resource data) provide the system with the information required to find and load the correct device drivers. One custom driver, the AD1815 Sound System driver from Analog Devices, is required for correct operation. In the other cases (MIDI, Game Port), the system can use generic drivers. Table III lists the AD1815’s logical devices and compatible Plug and Play device drivers.

Table III. Logical Devices and Compatible Plug and Play Device Drivers

Logical Device Number	Emulated Device	Compatible (Device ID)	Device ID
0	Sound System	—	ADS7150
1	MIDI MPU401 compatible	PNPB006	ADS7151
2	Game/Joystick port	PNPB02F	ADS7152

The configuration process for the logical devices on the AD1815 is described in the *Plug and Play ISA Specification Version 1.0a* (May 5, 1994). The specification describes how to transfer the logical devices from their start-up *Wait For Key* state to the *Config* state and how to assign I/O ranges, interrupt channels, and DMA channels. See Appendix A for an example setup program and specific Plug and Play resource data.

Table IV describes in detail the I/O Port Address Descriptors, DMA Channels, Interrupts for the functions required for the AD1815 Logical Device groups.

Table IV. Logical Device Configuration

LDN	PnP Function	Description
0	I/O Port Address Descriptor (0x60-0x61)	The Sound Blaster Pro address range is from 0x100 to 0x3F0. The typical address is 0x220. The range is 16 bytes long and must be aligned to a 16 byte memory boundary.
0	I/O Port Address Descriptor (0x62-0x63)	The Adlib address range is from 0x100 to 0x3F8. The typical address is 0x388. The range is 4 bytes long and must be aligned to a 8 byte memory boundary.
0	I/O Port Address Descriptor (0x64-0x65)	The Codec address range is from 0x100 to 0x3F8. The range is 16 bytes long and must be aligned to a 16 byte memory boundary.
0	Interrupt Request Level Select (0x70-0x71)	This IRQ is shared between the SB Pro device and the Codec. These devices require one of the following IRQ channels: 5, 7, 9, 11, 12, or 15. Typically, the IRQ is set to 5 or 7 for this device.
0	DMA Playback Channel Select (0x74)	This 8-bit channel is shared between the SB Pro device and the Codec for playback. These devices require one of the following DMA channels; 0, 1, 3. Typically, DMA channel 1 is set.
0	DMA Capture Channel Select (0x75)	This the DMA channel used for capturing Codec data. The Codec operates in single channel mode if a separate DMA channel for capture and playback is not assigned. The following DMA channels may be programmed; 0, 1, 3. DMA Channel 4 indicates single channel mode.
1	I/O Port Address Descriptor (0x60-0x61)	The MPU-401 compatible device address range is 0x100 to 0x3FE. Typical configurations use 0x330. The range is 2 bytes long and must be aligned to a 2 byte memory boundary.
1	Interrupt Request Level Select (0x70-0x71)	The MIDI device requires one of the following IRQ channels: 5, 7, 9, 11, 12, or 15.
2	I/O Port Address Descriptor (0x60-0x61)	The Game Port address range is from 0x100 to 0x3F8. The typical address is 0x200. The range is 8 bytes long and must be aligned to a 8 byte memory boundary.

NOTE

DMA channel 4 indicates single-channel mode.

Sound System Direct Registers

The AD1815 has a set of 16 programmable Sound System Direct Registers and 36 Indirect Registers. This section describes all the AD1815 registers and gives their address, name, and initialization state/reset value. Following each register table is a list (in ascending order) of the full register name, its usage, and its type: (RO) Read Only, (WO) Write Only, (STKY) Sticky, (RW) Read Write, and Reserved (res). Table V is a map of the AD1815 direct registers.

Table V. Sound System Direct Registers

Direct Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
BASE + 0	CRDY	IMRDY	INADR[5:0]					
BASE + 1	PI	CI	TI	VI	DI	RI	GI	SI
BASE + 2	Indirect SS Data [7:0]							
BASE + 3	Indirect SS Data [15:8]							
BASE + 4	RES	MOF	PUR	COR	ORR [1:0]		ORL [1:0]	
BASE + 5	PFH	PDR	PLR	PUL	CFH	CDR	CLR	CUL
BASE + 6	PIO Playback/Capture [7:0]							
BASE + 7	RESERVED							
BASE + 8	TRD	DAZ	PFMT [1:0]		PC/L	PST	PIO	PEN
BASE + 9	RES		CFMT [1:0]		PC/L	CST	CIO	CEN
BASE + 10	PIO MODEM OUT / IN [7:0]							
BASE + 11	PIO MODEM OUT / IN [15:8]							
BASE + 12	JOYSTICK DATA [7:0]							
BASE + 13	JRDY	JWRP	JSEL [1:0]		JMSK [3:0]			
BASE + 14	JAXIS [7:0]							
BASE + 15	JAXIS [15:8]							

[Base+0] Chip/Modem Status/Indirect Address

7	6	5	4	3	2	1	0		
CRDY	IMRDY	INADR[5:0]							RESET = [0x00]

INADR [5:0] (RW) Indirect Address for Sound System (SS). These bits are used to access the Indirect Registers shown in Table VIII. All registers data must be written in pairs, low byte followed by high byte, by loading the Indirect SS Data Registers, (Base +2) and (Base +3).

IMRDY (RO) ISA Modem Ready. The AD1815 asserts this bit when the modem can accept data.
 0 Modem not ready.
 1 Modem ready.

CRDY (RO) AD1815 Ready. The AD1815 asserts this bit when AD1815 can accept data.
 0 AD1815 not ready.
 1 AD1815 ready.

[Base+1] Interrupt Status

7	6	5	4	3	2	1	0	
PI	CI	TI	VI	DI	RI	GI	SI	RESET = [0x00]

SI (RO) SoundBlaster generated Interrupt.

0 No interrupt.
 1 SoundBlaster interrupt pending.

GI (RW) Game Interrupt (Sticky, Write "0" to Clear).

0 No interrupt.
 1 An interrupt is pending due to Digital Game Port data ready.

RI (RW) Ring Interrupt (Sticky, Write "0" to Clear).

0 No interrupt.
 1 An interrupt is pending due to a Hardware Ring pin being asserted.

DI (RW) DSP Interrupt (Sticky, Write "0" to Clear).

0 No interrupt.
 1 An interrupt is pending due to a write to the DIT bit in indirect register [33] bit <13>.

VI (RW) Volume Interrupt (Sticky, Write "0" to Clear).

0 No interrupt.
 1 An interrupt is pending due to Hardware Volume Button being pressed.

TI (RW) Timer Interrupt. This bit indicates there is an interrupt pending from the timer count registers. (Sticky, Write "0" to Clear).

0 No interrupt.
 1 Interrupt is pending from the timer count register.

CI (RW) Capture Interrupt. This bit indicates that there is an interrupt pending from the capture DMA count register. (Sticky, Write "0" to Clear).

0 No interrupt.
 1 Interrupt is pending from the capture DMA count register.

PI (RW) Playback Interrupt. This bit indicates that there is an interrupt pending from the playback DMA count register. (Sticky, Write "0" to Clear).

0 No interrupt.
 1 Interrupt is pending from the playback DMA count register.

[Base+2] Indirect SS Data Low Byte

7	6	5	4	3	2	1	0	
Indirect SS Data [7:0]								RESET = [0xXX]

[Base+3] Indirect SS Data High Byte

7	6	5	4	3	2	1	0	
Indirect SS Data [15:8]								RESET = [0xXX]

Indirect SS Data [15:0] Indirect Sound System Data. Data in this register is written to the Sound System Indirect Register specified by the address contained in INADR [5:0], Sound System Direct Register [Base +0]. Data is written when the Indirect SS Data High Byte value is loaded.

AD1815

[Base+4] PIO Debug

7	6	5	4	3	2	1	0	
RES	MOF	PUR	COR	ORR[1:0]	ORL[1:0]			RESET = [0x00]

All bits in this register are sticky until any write which clears all bits to 0.

ORL/ORR (RO) [1:0] Overrange Left/Right detect. These bits record the largest output magnitude on the ADC right and left channels and are cleared to 00 after any write to this register. The peak amplitude as recorded by these bits is “sticky,” i.e., the largest output magnitude recorded by these bits will persist until these bits are explicitly cleared. They are also cleared by powering down the ADC right channel.

ORL/ORR	Over/Under Range Detection
00	Less than -1 dB Underrange
01	Between -1 dB and 0 dB Underrange
10	Between 0 dB and 1 dB Overrange
11	Greater than 1 dB Overrange

COR (RO) Capture Over Run. The codec sets (1) this bit when capture data is not read within one sample period after the capture FIFO fills. When COR is set, the FIFO is full and the codec discards any new data generated. The codec clears this bit immediately after a four byte capture sample is read.

PUR (RO) Playback Under Run. The codec sets (1) this bit when playback data is not written within one sample period after the playback FIFO empties. The codec clears (0) this bit immediately after a four byte playback sample is written. When PUR is set the playback channel has “run out” of data and either plays back a mid-scale value or repeats the last sample.

MOF (RO) Modem Fail (“Sticky ”). The modem sets (1) this bit if in ISA modem mode (see Sound System Indirect Register 32, bit IME) and the four deep transmit/receive FIFO underruns.

[Base+5] PIO Status

7	6	5	4	3	2	1	0	
PFH	PDR	PLR	PUL	CFH	CDR	CLR	CUL	RESET = [0x00]

CUL (RO) Capture Upper/Lower Sample. This bit indicates whether the PIO capture data ready is for the upper or lower byte of the channel.
 0 Lower byte ready.
 1 Upper byte ready or any 8-bit mode.

CLR (RO) Capture Left/Right Sample. This bit indicates whether the PIO capture data waiting is for the left channel ADC or the right channel ADC.
 0 Right channel.
 1 Left channel or mono.

CDR (RO) Capture Data Ready. The PIO Capture Data register contains data ready for reading by the host. This bit should be used only when direct programmed I/O data transfers are desired (FIFO has at least 4 bytes before full).
 0 ADC is stale. Do not reread the information.
 1 ADC data is fresh. Ready for next host data read.

CFH (RO) Capture FIFO Half Full. (FIFO has at least 32 bytes before full.)

PUL (RO) Playback Upper/Lower Sample. This bit indicates whether the PIO playback data needed is for the upper or lower byte of the channel.
 0 Lower byte needed.
 1 Upper byte needed or any 8-bit mode.

PLR (RO) Playback Left/Right Sample. This bit indicates whether the PIO playback data needed is or the left channel DAC or the right channel DAC.
 0 Right channel needed.
 1 Left channel or mono.

PDR (RO) Playback Data Ready. The PIO Playback data register is ready for more data. This bit should only be used when direct programmed I/O data transfers are desired (FIFO can take at least 4 bytes).
 0 DAC data is still valid. Do not overwrite.
 1 DAC data is stale. Ready for next host data write value.

PFH (RO) Playback FIFO Half Empty. FIFO can take at least 32-bytes, 8 groups of 4-bytes.

[Base+6] PIO Data**PIO Playback/
Capture [7:0]**

The Programmed I/O (PIO) Data Registers for capture and playback are mapped to the same address. Writes send data to the Playback Register and reads will receive data from the Capture Register.

Reading this register will increment the capture byte state machine so that the following read will be from the next appropriate byte in the sample. The exact byte may be determined by reading the PIO Status Register. Once all relevant bytes have been read, the state machine will stay pointed to the last byte of the sample until a new sample is received.

Writing data to this register will increment the playback byte tracking state machine so that the following write will be to the correct byte of the sample. Once all bytes have been written, subsequent byte writes will be ignored. The state machine is reset when the current sample is transferred.

Note: All writes to the FIFO “MUST” contain 4 bytes of data.

- * 1 sample of 16-bit stereo
- * 2 samples of 16-bit mono
- * 2 samples of 8-bit stereo (Linear PCM, U-law PCM, A-Law PCM)
- * 4 samples of 8-bit mono (Linear PCM, U-law PCM, A-Law PCM)

[Base+7] Reserved**[Base+8] Playback Config**

PEN	(RW)	Playback Enable. This bit enables or disables programmed I/O data playback. 0 Disable 1 Enable
PIO	(RW)	Programmed Input/Output. This bit determines whether the playback data is transferred via DMA or PIO. 0 DMA transfers only. 1 PIO transfers only.
PST	(RW)	Playback Stereo/Mono select. These bits select stereo or mono formatting for the input audio data streams. In stereo, the Codec alternates samples between channels to provide left and right channel input. For mono, the Codec captures samples on the left channel stereo. 0 Mono 1 Stereo
PC/L	(RW)	Playback Companded/Linear Select. This bit selects between a linear digital representation of the audio signal or a nonlinear, companded format for all output data. The type of linear PCM or the type of companded format is defined by PFMT [1:0]. 0 Linear PCM 1 Companded
PFMT [1:0]	(RW)	Playback Format. Use these bits to select the playback data format for output data according to Table VI and Figure 15.
DAZ	(RW)	DAC zero. This bit forces the DAC to zero. 0 Repeat last sample. 1 Force DAC to ZERO.
TRD	(RW)	Transfer Request Disable. This bit enables or disables Codec DMA transfers during a Codec interrupt (indicated by the SS Codec Status register’s INT bit being set (1)). This assumes Codec DMA transfers were enabled and the SS Codec Indexed (0x09) Interface Configuration register’s PEN or CEN bits are set. 0 Transfer Request Enable. 1 Transfer Request Disable.

After setting format bits, sample data into the AD1815 must be ordered according to Figure 15, Table VI.

Figure 15. Codec Transfers

Table VI. Codec Transfers

[Base+9] (Capture Config)

- CEN (RW) Capture Enable. This bit enables or disables data capture.
 0 Disable
 1 Enable
- CIO (RW) Capture Programmed I/O. This bit determines whether the capture data is transferred via DMA or PIO.
 0 DMA
 1 PIO
- CST (RW) Capture Stereo/Mono Select. This bit selects stereo or mono formatting for the input audio data streams. In stereo, the Codec alternates samples between channels to provide left and right channel input. For mono, the Codec captures samples on the left channel.
 0 Mono
 1 Stereo
- CC/L (RW) Capture Companded/Linear Select. This bit selects between a linear digital representation of the audio signal or a nonlinear, companded format for all output data. The type of linear PCM or the type of companded format is defined by CFMT [1:0].
 0 Linear PCM
 1 Companded
- CFMT [1:0] (RW) Capture Format. Use these bits to select the format for capture data according to the following Table VI and Figure 15.

[Base+10] PIO Modem Data Low Byte**[Base+11] PIO Modem Data High Byte****[Base+12] Joystick RAW DATA**

DATA (RO) Joystick Data. Joystick Data (identical to 0x201): Writes to this register are ignored.

[Base+13] Joystick Control

JMSK [3:0] (RW) Joystick Axis Mask. JRDY bit calculated based on axes selected by JMSK only.

xxx1	Enable AX
xx1x	Enable AY
x1xx	Enable BX
1xxx	Enable BY

JSEL [1:0] (RW) Joystick Select. Selects one of four joystick axis register sets according to the following table:

00	Read AX (16 Bits) from [Base+14] & [Base+15]
01	Read AY (16 Bits) from [Base+14] & [Base+15]
10	Read BX (16 Bits) from [Base+14] & [Base+15]
11	Read BY (16 Bits) from [Base+14] & [Base+15]

JWRP (RW) Joystick Wrapmode. Continuous Joystick sampling mode—sampling automatically restarted every ~16 ms.

JRDY (RO) Joystick Ready. Sampling complete, joystick data ready for reading.

Note: Sampling must be started manually if JWRP is set before any sampling cycles are run. To start sampling AFTER setting the WRP bit, write to the joystick port [Base+14].

AD1815

[Base+14] Joystick Position Data Low Byte

JAXIS [7:0] (RO) Joystick Axis Low Byte.

Note: Axis to be read through this register is selected by the JSEL bits in the control register. A write to this register starts a sampling cycle.

[Base+15] Joystick Position Data High Byte

JAXIS [15:8] (RO) Joystick Axis High Byte.

Note: Axis to be read through this register is selected by the JSEL bits in the control register. A write to this register starts a sampling cycle.

Sound System Indirect Registers

Writing Indirect Registers

All Indirect Registers “MUST” be written in pairs: low byte followed by high byte. The Indirect Address Register [SSBASE+0] holds the address for a register pair, the Indirect Low Data Byte [SSBASE+2] is used to write low data byte and Indirect High Data Byte [SSBASE+3] is used to write the High data byte. The Low data byte is held in in the temporary register until the upper byte is written.

Programming Example

“Write Sample Rate for Playback to 11,000 (2AF8hex)”

- 1) Write [SSBASE+0] with 0x08; indirect register for playback sample rate
- 2) Write [SSBASE+2] with 0xF8; low byte of 16-bit sample rate register
- 3) Write [SSBASE+3] with 0x2A; high byte of 16-bit sample rate register

Reading Indirect Registers

All indirect registers can be read individually. The Sound System Indirect Address Register [SSBASE+0] holds the address for a register pair, the Indirect Low Data Byte [SSBASE+2] is used to read low data byte and Indirect High Data Byte [SSBASE+3] is used to read the High data byte.

Programming Example

“Read Sample Rate for Playback to 11,000 (2AF8hex)”

- 1) Write [SSBASE+0] with 0x08 ; Indirect register for Playback Sample Rate
- 2) Read [SSBASE+2] ; Low byte of 16-bit sample rate register
- 3) Read [SSBASE+3] ; High byte of 16-bit sample rate register

ISR Saves and Restores

For Interrupt Service Routines, ISRs, it is necessary to save and restore the Indirect Address and the Low Byte Temp Data registers inside the ISR.

Programming Example

“Save/Restore during an ISR”

Beginning of ISR:

- 1) Read [SSBASE+0] ; Save Indirect Address register to TMP_IA
- 2) Write [SSBASE+0] with 0x00; ; Indirect Register for Low Byte Temp Data
- 3) Read [SSBASE+2] ; Save Low Byte Temp data to TMP_LBT
- 4) ISR Code ; ISR routine
- 5) Write [SSBASE+2] with TMP_LBT ; Restore Low Byte Temp data TMP_LBT
- 6) Write [SSBASE+0] with TMP_IA ; Restore Indirect Address TMP_IA
- 7) Return from Interrupt ; Return from ISR

Table VII. Indirect Register Map and Reset/Default States

Index	Register Name	Reset/ Default State
0	Low Byte TMP	0xXX
1	Interrupt Enable and External Control	0x0102
2	Voice Playback Sample Rate	0x1F40

[08] PLAYBACK BASE COUNT

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
PBC [15:8]								PBC [7:0]							

PBC [15:0] Playback Base Count. This register is for loading the Playback DMA Count. Writing a value to this register also loads the same data into the Playback Current Count register. You must load this register when Playback Enable (PEN) is de-asserted. When PEN is asserted, the Playback Current Count decrements once for every four-bytes which are transferred via a DMA cycle. The next transfer, after zero is reached in the Playback Current Count, will generate an interrupt and will reload the Playback Current Count with the value in the Playback Base Count. The Playback Base Count should always be programmed to Number-Bytes divided by four, minus one ((Number-Bytes/4) -1). The circular software DMA buffer must be divisible by four to ensure proper operation.

[09] PLAYBACK CURRENT COUNT

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
PCC [15:8]								PCC [7:0]							

PCC [15:0] Playback Current Count register. Contains the current Playback DMA Count. Reads and Writes must be done when PEN is de-asserted.

[10] CAPTURE BASE COUNT

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
CBC [15:8]								CBC [7:0]							

CBC [15:0] Capture Base Count. This register is for loading the Capture DMA Count. Writing a value to this register also loads the same data into the Capture Current Count register. Loading must be done when Capture Enable (CEN) is de-asserted. When CEN is asserted, the Capture Current Count decrements once for every four-bytes which are transferred via a DMA cycle. The next transfer, after zero is reached in the Capture Current Count, will generate an interrupt and will reload the Capture Current Count with the value in the Capture Base Count. The Capture Base Count should always be programmed to Number-Bytes divided by four, minus one ((Number-Bytes/4) -1). The circular software DMA buffer must be divisible by four to ensure proper operation.

[11] CAPTURE CURRENT COUNT

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
CCC [15:8]								CCC [7:0]							

CCC [15:0] Capture Current Count register. Contains the current Capture DMA Count. Reading and Writing must be done when CEN is de-asserted.

[12] TIMER BASE COUNT

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
TBC [15:8]								TBC [7:0]							

TBC [15:0] Timer Base Count. Register for loading the Timer Count. Writing a value to this register also loads the same data into the Timer Current Count register. Loading must be done when Timer Enable (TE) is de-asserted. When TE is asserted, the Timer Current Count register decrements once for every specified time period. The time period

(10 μ s or 100 ms) is programmed via the PTB bit in WS[44]. When TE is asserted, the Timer Current Count decrements once every time period. The next count, after zero is reached in the Timer Current Count register, will generate an interrupt and will reload the Timer Current Count register with the value in the Timer Current Count register.

[13] TIMER CURRENT COUNT **DEFAULT = [0x0000]**

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
TCC [15:8]								TCC [7:0]							

TCC [15:0] Timer DMA Current Count register. Contains the current timer count. Reading and Writing must be done when TE is de-asserted.

[14] MASTER VOLUME ATTENUATION **DEFAULT = [0x0000]**

RES							VMU	VUP	VDN	BM [4:0]					

BM [4:0] Button Modifier

VDM Volume Down

VUP Volume Up

VMU Volume Mute

This register contains a MASTER VOLUME attenuation offset that can be incremented or decremented via the Hardware Volume Pins. This Register is summed with the MASTER VOLUME attenuation to produce the actual MASTER VOLUME DAC attenuation. A momentary press of greater than 50 ms on the VOLUME-UP pin will cause a decrement (decrease in Attenuation) in this register. Holding the pin for greater than 200 ms will cause an auto-decrement every 200 ms. This is also true for a momentary press of the VOLUME-DOWN pin. A momentary press of both the VOLUME-UP and VOLUME-DOWN causes a mute and no increment or decrement to occur.

When Muted, an un-mute is possible by either a momentary press of both the VOLUME-UP and VOLUME-DOWN pins together, a momentary press of VOLUME-UP (this also causes a volume increase), a momentary press of VOLUME-DOWN (this also causes a volume decrease) or a write of "0" to the VI bit in SS[BASE+1].

[42] DSP MAILBOX 0

DEFAULT = [0x0000]

MB1R [15:0] This register is used to send data and control information to and from the DSP.

[44] POWERDOWN and TIMER CONTROL

DEFAULT = [0x0000]

7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
CPD	RES	PIW	PIR	PAA	PDA	PDP	PTB	RES							

The AD1815 supports a time-out mechanism used in conjunction with the TIMER BASE COUNT/TIMER CURRENT COUNT registers to generate a powerdown interrupt. This interrupt allows software to powerdown the entire chip by setting the CPD bit. This powerdown control feature lets users program a time interval from 1 ms to approximately 1.8 hours in 1 ms increments. Five powerdown count reload enable bits are used to reload the TIMER CURRENT COUNT from the TIMER BASE COUNT when activity is seen on that particular channel.

Programming Example: Generate Interrupt if No ISA Reads or Writes occur within 15 Minutes.

- 1) Write [SSBASE+0] with 0x0C ; Write Indirect address for TIMER BASE COUNT "register 12"
- 2) Write [SSBASE+2] with 0x28 ; Write TIMER BASE COUNT with (15min * 60sec/min * 10) = 0x2328 milli-Seconds
- 3) Write [SSBASE+3] with 0x23 ; Write High byte of TIMER BASE COUNT
- 4) Write [SSBASE+0] with 0x2C ; Write Indirect address for POWERDOWN and TIMER CONTROL register
- 5) Write [SSBASE+2] with 0x00 ; Write Low byte of POWERDOWN and TIMER CONTROL register
- 6) Write [SSBASE+3] with 0x30 ; Set Enable bits for PIW & PIR
- 7) Write [SSBASE+0] with 0x01 ; Write Indirect address for INTERRUPT CONFIG register
- 8) Write [SSBASE+2] with 0x82 ; Set the TE (Timer Enable) bit
- 9) Write [SSBASE+3] with 0x20 ; Set the TIE (Timer Interrupt Enable) bit

- PTB Powerdown Time Base. 1 = timer set to 100 ms, 0 = timer set to 10 μ s.
- PDP Powerdown count reload on DSP Port enabled; "1" = Reload count if DSP Port enabled DSP Port enabled defined as:
- PDA Powerdown count reload on Digital Activity; "1" = Reload count on Digital Activity Digital Activity is defined as: Any activity on (I²S0, I²S1, FM or PLAYBACK).
- PAA Powerdown count reload on Analog Activity; "1" = Reload count on Analog Activity; Analog Activity is defined as: Any analog input un-muted (LINE, CD, SYNTH, MIC, MONO) or MASTER VOLUME un-muted.
- PIR Powerdown count reload on ISA Read; "1" = Reload count on ISA read; ISA Read is defined as: A read from any active logical device inside the AD1815
- PIW Powerdown count reload on ISA Write; "1" = Reload count on ISA write; ISA Write defined as: A write to any active logical device inside the AD1815
- CPD Chip Powerdown
 1 Powerdown;
 0 Powerup

For Powerup, software should POLL the [SSBASE+0] CRY bit for "1" before writing or reading any logical device.

Test register. Should never be written or read under normal operation

SB Pro; Adlib Registers

The AD1815 contains sets of ISA Bus registers (ports) that correspond to those used by the Sound Blaster Pro audio card from Creative Labs and the AdLib audio card from AdLib Multimedia. Table IX lists the ISA Bus Sound Blaster Pro registers. Table X lists the ISA Bus AdLib registers. Because the AdLib registers are a subset of those in the Sound Blaster card, you can find complete information on using both of these registers in the *Developer Kit for Sound Blaster Series, 2nd ed.* ©1993, Creative Labs, Inc., 1901 McCarthy Blvd., Milpitas, CA 95035.

Table IX. Sound Blaster Pro ISA Bus Registers

Register Name	ISA Bus Address
Music0: Address (w), Status (r)	0x(SB Base) Relocatable in range 0x010 – 0x3F0
Music0: Data (w)	0x(SB Base+1)
Music1: Address (w)	0x(SB Base+2)
Music1: Data (w)	0x(SB Base+3)
Mixer Address (w)	0x(SB Base+4)
Mixer Data (w)	0x(SB Base+5)
Reset (w)	0x(SB Base+6)
Music0: Address (w)	0x(SB Base+8)
Music0: Data (w)	0x(SB Base+9)
Input Data (r)	0x(SB Base+A)
Status (r), Output Data (w)	0x(SB Base+C)
Status (r)	0x(SB Base+E)

Table X. Adlib ISA Bus Registers

Register Name	ISA Bus Address
Music0: Address (w), Status (r)	0x(Adlib Base) Relocatable in range 0x008 – 0x3F8
Music0: Data (w)	0x(Adlib Base+1)
Music1: Address (w)	0x(Adlib Base+2)
Music1: Data (w)	0x(Adlib Base+3)

AD1815

MIDI and MPU-401 Registers

The AD1815 contains a set of ISA Bus registers (ports) that correspond to those used by the ISA bus MIDI audio interface cards. Table XI lists the ISA Bus MIDI registers. These registers support commands and data transfers described in *MIDI 1.0 Detailed Specification and Standard MIDI Files 1.0*, ©1994, MIDI Manufacturers Association, PO Box 3173 La Habra, CA 90632-3173.

Table XI. MIDI ISA Bus Registers

Register Name	Address
MIDI Data (r/w)	0x(MIDI Base) Relocatable in range 0x008 to 0x3F8
MIDI Status (r), Command (w)	0x(MIDI Base+1)

0x(MIDI Base+1)

BIT	7	6	5	4	3	2	1	0
STATE	1	0	0	0	0	0	0	0
NAME	DRR	DSR	RESERVED					

- DSR (R) Data Send Ready. When read, this bit indicates that you can (0) or cannot (1) write to the MIDI Data register. (Full = 1, Empty = 0)
- DRR (R) Data Receive Ready. When read, this bit indicates that you can (0) or cannot (1) read from the MIDI Data register. (Unreadable = 1, Readable = 0)
- CMD [7:0] (W) MIDI Command. Write MPU-401 commands to bits [7:0] of this register.

NOTES

The AD1815 *only* supports the MIDI 0xFF (reset) and 0x3F (pass-through mode) commands. The controller powers setup for intelligent MIDI mode, but must be put in pass-through mode. To start MIDI operations, send a reset command (0xFF) and then send a pass-through mode command (0x3F). The MIDI data register contains an acknowledge byte (0xFE) after each command transfer.

All commands return an ACK byte in “smart” mode.

Status commands (0xAx) return ACK and a data byte; all other commands return ACK.

All commands except reset (0xFF) are ignored in UART mode. No ACK bytes are returned.

“Smart” mode data transfers are not supported.

Game Port Registers

The AD1815 contains a Game Port ISA Bus Register that corresponds to the game port described in the PnP specification.

Table XII. Game Port ISA Bus Registers

Register Name	Address
Game Port I/O	0x(Game Port Base+0 to Game Port Base+7) Relocatable in the range 0x100 to 0x3F8

APPENDIX A

Additional Plug and Play Programming Information

The following is an example of the programming steps for a quick Plug and Play setup. This example is intended for use in evaluating the AD1815. The example PnP code may cause conflicts with other PnP devices.

1	0	0	279	30	Enable GAME.
1	0	0	A79	01	
1	0	0	226	01	Put SB in reset (good to do while running CODEC tests)

Plug and Play Key & “Alternate Key” Sequences

One additional feature of the AD1815 is an alternate programming method which is used, for example, if a BIOS wants to assume control of the AD1815 and present DEVNODES to the OS (rather than having the device participate in Plug and Play enumeration). The following technique can be used.

Instead of the normal 32 byte Plug and Play key sequence, an alternate 126 byte key is used. After the 126 byte key, the AD1815 device will transition to the Plug and Play “config” state. It can then be programmed as usual using the standard Plug and Play ports. After programming, the AD1815 should be sent to the Plug and Play “WFK” (wait for key) state. Once the AD1815 has seen the alternate key, it will no longer parse for the Plug and Play key (and therefore never participate in Plug and Play enumeration). It can be reprogrammed by reissuing the alternate key again.

Both the Plug and Play key and the alternate key are sequences of writes to the Plug and Play address register, 0x279. Below are the ISA data values of both keys.

This is the standard Plug and Play sequence:

```
6a b5 da ed f6 fb 7d be df 6f 37 1b 0d 86 c3 61
b0 58 2c 16 8b 45 a2 d1 e8 74 3a 9d ce e7 73 39
```

This is the longer, 126-byte alternate key. It is generated by the function:

$$f[n+1] = (f[n] \gg 1) | (((f[n] \wedge (f[n] \gg 1)) \& 0x01) \ll 6)$$

$$f[0] = 0x01$$

```
01 40 20 10 08 04 02 41 60 30 18 0c 06 43 21 50
28 14 0a 45 62 71 78 3c 1e 4f 27 13 09 44 22 51
68 34 1a 4d 66 73 39 5c 2e 57 2b 15 4a 65 72 79
7c 3e 5f 2f 17 0b 05 42 61 70 38 1c 0e 47 23 11
48 24 12 49 64 32 59 6c 36 5b 2d 56 6b 35 5a 6d
76 7b 3d 5e 6f 37 1b 0d 46 63 31 58 2c 16 4b 25
