DESCRIPTION

The **66063** single channel optocoupler consists of an LED optically coupled to a high speed, high gain inverting detector gate. Maximum isolation can be achieved while providing TTL output capable of switching with propagation delays of 55ns typical. The 66063 is a 24 pin hermetically sealed leadless chip carrier and is available in standard and screened versions or tested to customer specifications.

NOTES:

1. Measured between pins 1 and 2 shorted together, and pins 10, 14 and 15 shorted together.
2. The t_{PHL} propagation delay is measured from the 6.5mA point on the trailing edge of the input pulse to the 1.5V point on the trailing edge of the output pulse.
3. The t_{PHL} propagation delay is measured from the 6.5mA point on the leading edge of the input pulse to the 1.5V point on the leading edge of the output pulse.
4. CM_H is the max. tolerable common mode transient to assure that the output will remain in a high logic state (i.e. $V_O > 2.0\text{V}$).
5. CM_L is the max. tolerable common mode transient to assure that the output will remain in a low logic state (i.e. $V_O < 0.8\text{V}$).
6. It is essential that a bypass capacitor (.01 to 0.1 μF , ceramic) be connected from pin 10 to pin 15.
