

# ALS headphone driver

## BA3570F/BA3570FS

The BA3570F and BA3570FS are stereo headphone amplifiers with ALS (Auto Loudness System) which have been designed for use as headphone drivers in audio equipment.

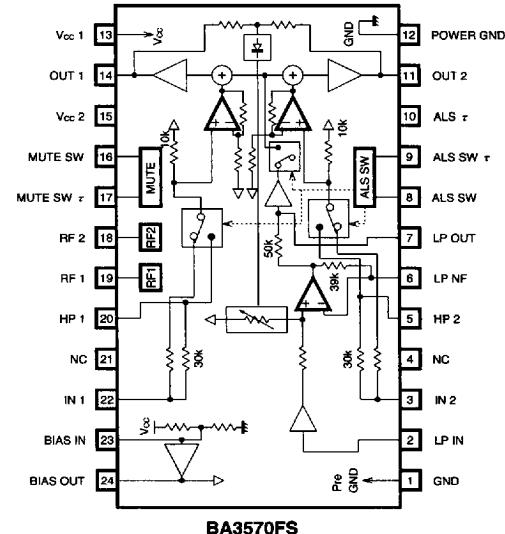

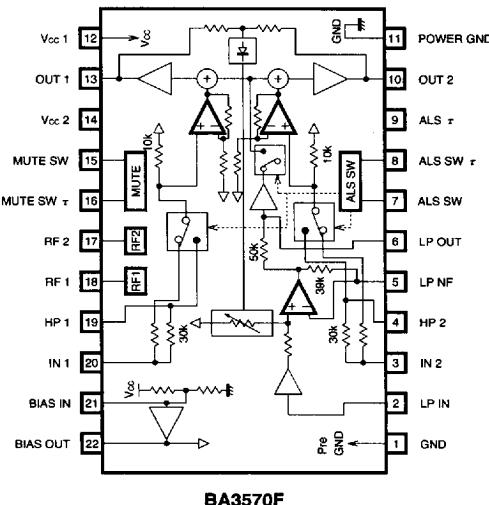

### ● Applications

Stereo headphones

### ● Features

- 1) The use of ALS (Auto Loudness System) makes it possible to obtain a dynamic sound regardless of the volume level.
- 2) Built-in power mute circuit.
- 3) Built-in bypass circuit.

### ● Block diagram

## ●Pin description (pin numbers are for 22-pin BA3570F)

Pin No.	Pin name	Function
1	GND	Pre-ground
2	LP IN	Positive input of bass amp
3	IN2	Input 2
4	HP2	Treble input 2
5	LP NF	Negative input of bass amp
6	LP OUT	Bass amp output
7	ALS SW	ALS ON/OFF switch pin
8	ALS SW $\tau$	Pin for setting value for ALS ON/OFF
9	ALS $\tau$	Pin for setting value for ALS
10	OUT2	Output 2
11	POWER GND	Substrate ground
12	Vcc1	Supply voltage 1
13	OUT1	Output 1
14	Vcc2	Supply voltage 2
15	MUTE SW	Mute ON/OFF switch pin
16	MUTE SW $\tau$	Pin for setting value for mute ON/OFF
17	RF2	Ripple filter 2
18	RF1	Ripple filter 1
19	HP1	Treble input 1
20	IN1	Input 1
21	BIAS IN	Bias amp input
22	BIAS OUT	Bias amp output

## ●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Supply voltage	Vcc	9.0	V
Power dissipation	Pd	550*	mW
BA3570FS	Pd	800*	
Operating temperature	Topr	-25~75	°C
Storage temperature	Tstg	-55~125	°C

When mounted on 70 x 70 x 1.6 mm glass epoxy board.

\* When used above Ta = 25°C, the BA3570F value decreases 5.5 mW per degree and the BA3570FS value decreases 8.0 mW per degree.

## ●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Range	Unit
Supply voltage	Vcc	2.0~7.2	V

●Electrical characteristics (unless otherwise indicated,  $T_a = 25^\circ\text{C}$ ,  $V_{CC} = 3.0\text{V}$ ,  $R_L = 16\Omega$ ,  $f = 1\text{kHz}$ , and the Measurement circuit is as shown in Fig. 1)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions
Quiescent circuit current	$I_Q$	—	9	18	mA	$V_{IN}=0\text{V}_{rms}$
Voltage gain	$G_V$	13.5	15	16.5	dB	
Rated output power	$P_{OUT}$	20	30	—	mW	$\text{THD}=10\%$
Total harmonic distortion	$\text{THD}$	—	0.15	1.0	%	$V_o=-16\text{dBm}$
Channel balance	$CB$	-1.5	0	1.5	dB	$V_o=-16\text{dBm}$
Output noise voltage 1	$V_{NO1}$	—	-92	-88	dBm	$\text{IHF-A, ALS=OFF}$
Output noise voltage 2	$V_{NO2}$	—	-88	-84	dBm	$\text{IHF-A, ALS=ON}$
Input resistance	$R_{IN}$	10.8	13.5	16.2	kΩ	3、22Pin
Ripple rejection 1	$RR1$	29.5	41	—	dB	$f_{RR}=100\text{Hz}, V_{RR}=-30\text{dBm}, \text{ALS=ON}$
Ripple rejection 2	$RR2$	32	44	—	dB	$f_{RR}=100\text{Hz}, V_{RR}=-30\text{dBm}, \text{ALS=OFF}$
Boost 1	$BB1$	11	14	17	dB	$f=100\text{Hz}, V_{IN}=-42\text{dBm}$
Boost 2	$BB2$	6.5	9.5	12.5	dB	$f=100\text{Hz}, V_{IN}=-32\text{dBm}$
Boost 3	$BB3$	-3	0	3	dB	$f=100\text{Hz}, V_{IN}=-22\text{dBm}$
Channel separation	$CS$	52	62	—	dB	$\text{ALS=OFF, } f=1\text{kHz}$
Signal leak	$SL$	—	-67	-62	dBm	$R_g=0, V_{IN}=0\text{dBm}$ 3、22Pin
Mute level	$ML$	—	-85	-79	dBm	$16\text{Pin}=V_{CC}, V_{IN}=-20\text{dBm}$ 3、22Pin

## ● Explanation of ALS operation and external connections (pin numbers are for 22-pin BA3570F)

## 1. ALS ON

When ALS is on, the signal circuit (including external connections) is as shown in Fig. 2.

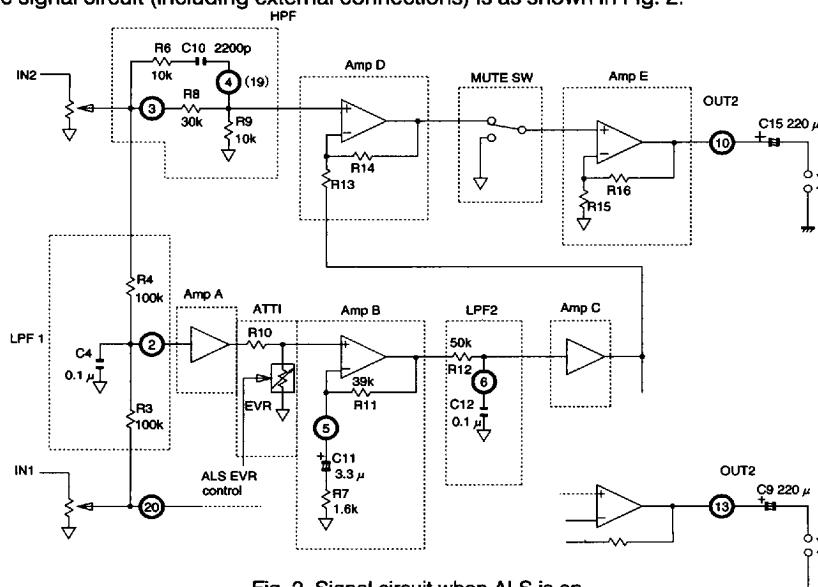

Fig. 2 Signal circuit when ALS is on

## 1-1. Bass signal transmission and gain vs. frequency

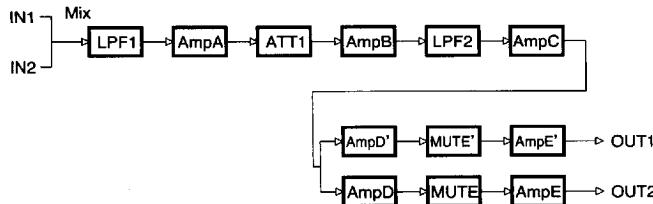

Fig. 3

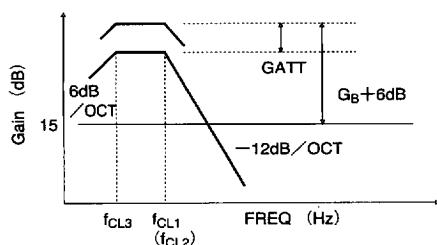

Fig. 4 Total frequency characteristics of bass signals

The gain and cutoff frequency of each block is as follows :

$$\text{LPF1 cutoff frequency} : f_{\text{CL1}} = \frac{1}{2\pi \cdot (R_3//R_4) \cdot C_4} \quad (\text{Hz})$$

$$\text{Amp A gain} : G_{\text{V(A)}} = 0 \quad (\text{dB})$$

$$\text{ATT attenuation} : G_{\text{V(ATT)}} = 20 \log \frac{\text{EVR}}{R_{10} + \text{EVR}} \quad (\text{dB})$$

$$\text{Amp B gain} : G_{\text{V(B)}} = 20 \log \frac{R_7 + R_{11}}{R_7} \quad (\text{dB})$$

$$\text{Amp B cutoff frequency} : f_{\text{CL3}} = \frac{1}{2\pi \cdot R_7 \cdot C_{11}} \quad (\text{Hz})$$

$$\text{LPF2 cutoff frequency} : f_{\text{CL2}} = \frac{1}{2\pi \cdot R_{12} \cdot C_{12}} \quad (\text{Hz})$$

$$\text{Amp C gain} : G_{\text{V(C)}} = 0 \quad (\text{dB})$$

$$\text{Amp D gain} : G_{\text{V(D)}} = 20 \log \frac{R_{14}}{R_{13}} \quad (\text{dB})$$

$$\text{Mute switch gain} : G_{\text{V(MUTE)}} = 0 \quad (\text{dB})$$

$$\text{Amp E gain} : G_{\text{V(E)}} = 20 \log \frac{R_{15} + R_{16}}{R_{15}} \quad (\text{dB}) \leftarrow -15 \text{dB}$$

In this case,  $R_3 = R_4 = 2 \cdot R_{12}$  ( $= 100 \text{ k}\Omega$ ) and  $C_4 = C_{12}$  ( $= 0.1 \mu\text{F}$ ), therefore  $f_{\text{CL1}} = f_{\text{CL2}}$  ( $= 32 \text{ Hz}$ ), and the frequency characteristic is bass boost (-12 dB/OCT) as shown in Fig. 4. Also,  $R_{14} = 2 \cdot R_{13}$ , therefore  $G_{\text{V(D)}} = 6 \text{ (dB)}$  and the EVR MAX total gain  $G_{\text{LMAX}}$  when signals are input from both channels is

$$\begin{aligned} G_{\text{LMAX}} &= G_{\text{V(A)}} + G_{\text{V(B)}} + G_{\text{V(C)}} + G_{\text{V(D)}} \\ &\quad + G_{\text{V(MUTE)}} + G_{\text{V(E)}} \\ &= G_{\text{V(B)}} + 6 + 15 \quad (\text{dB}) \end{aligned}$$

The gain and cutoff frequency of each block is as follows :

$$\text{HPF cutoff frequency 1} : f_{\text{CL3}} = \frac{1}{2\pi \cdot (R_6 + R_8) \cdot C_{10}} \quad (\text{Hz})$$

■ 7828999 0019416 435 ■

**ROHM**

$$\text{HPF cutoff frequency 2 : } f_{CH2} = \frac{R_8 + R_9}{2\pi \cdot (R_8R_9 + R_8R_{10} + R_9R_{10}) \cdot C_{10}} \quad (\text{Hz})$$

$$\text{Amp D' gain : } G_{V(D)} = 20\log \frac{R_{19} + R_{20}}{R_{19}} \quad (\text{dB})$$

As  $R_{17} = R_{18}$  and  $R_{19} = R_{20}$ , the total gain  $G_{V(OFF)}$  when ALS is off is

$$G_{V(OFF)} = G_{V(ATT2)} - 6 + G_{V(D)} + 6 + G_{V(MUTE)} + G_{V(E)} = 15 \quad (\text{dB})$$

and it is flat as shown in Fig. 8.

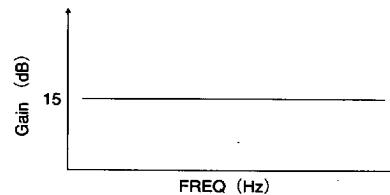

Fig. 8 Total frequency characteristics when ALS is off

### 1-3. Combined frequency characteristics

As shown in Fig. 6, the ALS characteristics can be obtained from the bass characteristics (Fig. 4) and the treble characteristics (Fig. 6).

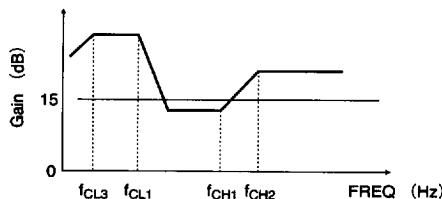

Fig. 6 ALS frequency characteristics

## 2. ALS OFF

The signal circuit when ALS is off is shown in Fig. 7.

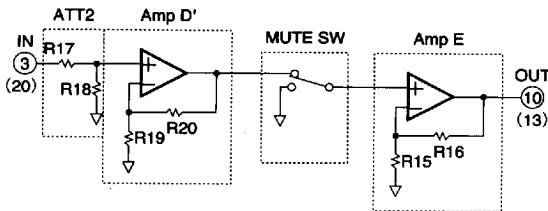

Fig. 7 Signal circuit when ALS is off

The gain and cutoff frequency of each block is as follows :

$$\text{ATT2 attenuation : } G_{V(ATT2)} = 20\log \frac{R_{18}}{R_{17} + R_{18}} \quad (\text{dB})$$

●Explanation of ALS operation and external connections

1-4. ALS system control circuit

The ALS system control circuit is shown in Fig. 9.

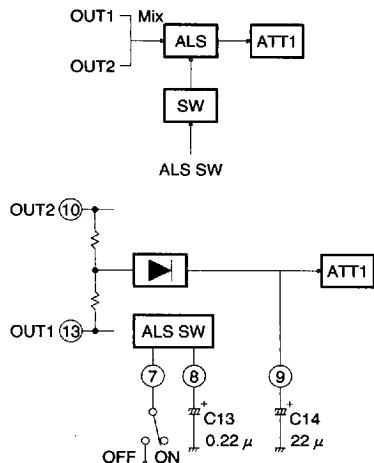

Fig. 9 ALS system control circuits

• ALS mode switching table

ALS mode	Pin ⑦ voltage
ALS ON	OPEN
ALS OFF	BIAS OUT

• ALS SW  $\tau$  external connection value : C13

By increasing the capacitance of C13, the switching sound made when ALS is turned on or off can be reduced, however, the switching time will increase. Set the value appropriately for the application.

• ALS  $\tau$  external connection value : C14

The ALC attack and recovery time for ALS is determined by C14 connected to the  $\tau$  pin (Pin 9).

●Mute amplifier (pin numbers are for 22-pin BA3507F)  
The output muting can be switched on or off.

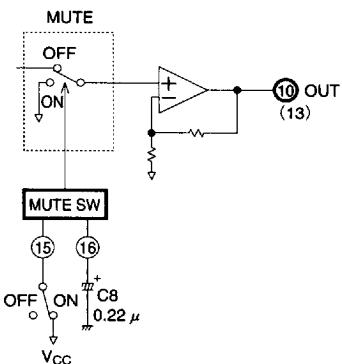

Fig. 10 Mute circuit

●Mute switching table

MUTE	Pin ⑯ voltage
ON	Vcc
OFF	OPEN

●MUTE SW  $\tau$  external connection value : C8

By increasing the capacitance of C8, the switching sound made when the mute is turned on or off can be reduced, however, the switching time will increase. Set the value appropriately for the application.
