

Features

- 4 Gigabit Ports with GMII and PCS interface
 - Gigabit Port can also support 100/10 Mbps MII interface
- High Performance Layer 2 Packet Forwarding (11.904M packets per second) and Filtering at Full-Wire Speed
- Maximum throughput is 4 Gbps non-blocking
- Centralized shared-memory architecture
- Consists of two Memory Domains at 133 MHz
 - Frame Buffer Domain: one bank of ZBT-SRAM with 1M/2MB total
 - Switch Database Domain with 256K/512K SRAM.
- Up to 64K MAC addresses to provide large node aggregation in wiring closet switches

Traffic Classification

- Classify traffic into 8 transmission priorities per port
- Supports Delay bounded, Strict Priority, and WFQ
- Provides 2 level dropping precedence with

DS5748

Issue 1.1

May 2002

Ordering Information

MVTX2801AG 596-pin BGA

-40°C to + 85°C

WRED mechanism

- User controlled thresholds for WRED
- Classification based on layer 2, 3 markings
 - VLAN Priority field in VLAN tagged frame.
 - DS/TOS field in IP packet
 - The precedence of above two classifications can be programmable
- QoS Support
- Supports IEEE 802.1p/Q Quality of Service with 8 Priority
- Buffer Management: reserve buffers on per class and per port basis
- Port-based Priority: VLAN Priority with Tagged frame can be overwritten by the priority of PVID
- QoS features can be configured on a per port basis Control
- Full Duplex Ethernet IEEE 802.3x Flow Control

Figure 1 - Chip Block Diagram

- Provides Ethernet Multicast and Broadcast Control
- 2 Port Trunking groups, max of 3 ports per group (Trunking can be based on source MAC and/or destination MAC and source port)
- LED signals provided by a serial or parallel interface
- Synchronous Serial Interface and I²C interface in unmanaged mode.
- Hardware auto-negotiation through serial management interface (MDIO) for Gigabit Ethernet ports, supports 10/100/1000 Mbps
- BIST for internal and external SRAM-ZBT
- I²C EEPROM or synchronous serial port for configuration
- Packaged in 596-pin BGA

Description

The MVTX2800AG family is a group of 8-port 1000 Mbps non-blocking Ethernet switch chips with on-chip address memory. A single chip provides a maximum of eight 1000 Mbps ports and a dedicated CPU interface with a 16/8-bit bus for managed and unmanaged switch applications. The VTX2800 family consists of the following four products:

- VTX2804 8 Gigabit ports Managed
- VTX2803 8 Gigabit ports Unmanaged
- VTX2802 4 Gigabit ports Managed
- VTX2801 4 Gigabit ports Unmanaged

The MVTX2801AG supports up to 64K MAC addresses to aggregate traffic from multiple wiring closet stacks. The centralized shared-memory architecture allows a very high performance packet-forwarding rate of 11.904M packet per second at full wire speed. The chip is optimized to provide a low-cost, high performance workgroup, and wiring closet, layer 2 switching solution with 4 Gigabit Ethernet ports.

One Frame Buffer Memory domain utilize cost effective, high-performance ZBT-SRAM with aggregated bandwidth of 8.5Gbps to support full wire speed on all external ports simultaneously.

With Strict priority, Delay Bounded, and WRR transmission scheduling, plus WRED memory congestion scheme, the chip provides powerful QoS functions for convergent network multimedia and mission-critical applications. The chip provides 8 transmission priorities and 2 level drop precedence. Traffic is assigned its transmission priority and dropping precedence based on the frame VLAN Tag priority.

The MVTX2801AG supports port trunking/load sharing on the 1000 Mbps ports with fail-over capability. The port trunking/load sharing can be used to group ports between interlinked switches to increase the effective network bandwidth.

In full-duplex mode, IEEE 802.3x flow control is provided. The Physical Coding Sublayer (PCS) is integrated on-chip to provide a direct 10-bit GMII interface, or the PCS can be bypassed to provide an interface to existing fiber-based Gigabit Ethernet transceivers.

The MVTX2801AG is fabricated using 0.25μm technology. Inputs, however, are 3.3V tolerant and the outputs are capable of directly interfacing to LVTTTL levels. The MVTX2801AG is packaged in a 596-pin Ball Grid Array package.

1.0 Block Functionality

1.1 Frame Data Buffer (FDB) Interfaces

The FDB interface supports pipelined ZBT-SRAM memory at 133 MHz. To ensure a non-blocking switch, one memory domain is required. Each domain has a 64-bit wide memory bus. At 133 MHz, the aggregate memory bandwidth is 8.5 Gbps, which is enough to support 4 Gigabit ports at full wire speed switching. A patent pending scheme is used to access the FDB memory. Each slot has one tick to read or write 8 bytes.

1.2 Switch Database (SDB) Interface

A pipelined synchronous burst SRAM (SBRAM) memory is used to store the switch database information including MAC Table. Search Engine accesses the switch database via SDB interface. The SDB bus has 32-bit wide bus at 133MHz.

1.3 GMII/PCS MAC Module (GMAC)

The GMII/PCS Media Access Control (MAC) module provides the necessary buffers and control interface between the Frame Engine (FE) and the external physical device (PHY). The MVTX2801AG has two interfaces, GMII or PCS. The MAC of the MVTX2801AG meets the IEEE 802.3z specification and supports the MII interface. It is able to operate 10M/100M/1G in Full Duplex mode with a back pressure/flow control mechanism. It has the options to insert Source Address/CRC/VLAN ID to each frame. The GMII/PCS Module also supports hot plug detection.

1.4 Frame Engine

The main function of the frame engine is to forward a frame to its proper destination port or ports. When a frame arrives, the frame engine parses the frame header (64 bytes) and formulates a switching request, which is sent to the search engine to resolve the destination port. The arriving frame is moved to the FDB. After receiving a switch response from the search engine, the frame engine performs transmission scheduling based on the frame's priority. The frame engine forwards the frame to the MAC module when the frame is ready to be sent.

1.5 Search Engine

The Search Engine resolves the frame's destination port or ports according to the destination MAC address (L2) by searching the database. It also performs MAC learning, priority assignment, and trunking functions.

1.6 LED Interface

The LED interface can be operated in a serial mode or a parallel mode. In the serial mode, the LED interface uses 3 pins for carrying 4 port status signals. In the parallel mode, the interface can drive LEDs by 8 status pins. The LED port is shared with bootstrap pins. In order to avoid error when reading the bootstraps, a buffer must be used to isolate the LED circuitry from the bootstrap pins during bootstrap cycle (the bootstrap pins are sampled at the rising edge of the Reset).

1.7 Internal Memory

Several internal tables are required and are described as follows:

- Frame Control Block (FCB) - Each FCB entry contains the control information of the associated frame stored in the FDB, e.g. frame size, read/write pointer, transmission priority, etc.
- MCT Link Table - The MCT Link Table stores the linked list of MCT entries that have collisions in the external MAC Table.

2.0 System Configuration

The MVTX2801AG can be configured by EEPROM (24C02 or compatible) via an I²C interface at boot time, or via a synchronous serial interface during operation.

2.1 I²C Interface

The I²C interface uses two bus lines, a serial data line (SDA) and a serial clock line (SCL). The SCL line carries the control signals that facilitate the transfer of information from EEPROM to the switch. Data transfer is 8-bit serial and bi-directional, at 50 Kbps. Data transfer is performed between master and slave IC using a request / acknowledgment style of protocol. The master IC generates the timing signals and terminates data transfer. The figure below shows the data transfer format.

START	SLAVE ADDRESS	R/W	ACK	DATA 1 (8 bits)	ACK	DATA 2	ACK	DATA M	ACK	STOP
-------	---------------	-----	-----	-----------------	-----	--------	-----	--------	-----	------

Figure 2 - Data Transfer Format for I²C Interface

2.1.1 Start Condition

Generated by the master, the MVTX2801AG. The bus is considered to be busy after the Start condition is generated. The Start condition occurs if while the SCL line is High, there is a High-to-Low transition of the SDA line.

Other than in the Start condition (and Stop condition), the data on the SDA line must be stable during the High period of SCL. The High or Low state of SDA can only change when SCL is Low. In addition, when the I²C bus is free, both lines are High.

2.1.2 Address

The first byte after the Start condition determines which slave the master will select. The slave in our case is the EEPROM. The first seven bits of the first data byte make up the slave address.

2.1.3 Data Direction

The eighth bit in the first byte after the Start condition determines the direction (R/W) of the message. A master transmitter sets this bit to W; a master receiver sets this bit to R.

2.1.4 Acknowledgment

Like all clock pulses, the master generates the acknowledgment-related clock pulse. However, the transmitter releases the SDA line (High) during the acknowledgment clock pulse. Furthermore, the receiver must pull down the SDA line during the acknowledge pulse so that it remains stable Low during the High period of this clock pulse. An acknowledgment pulse follows every byte transfer.

If a slave receiver does not acknowledge after any byte, then the master generates a Stop condition and aborts the transfer.

If a master receiver does not acknowledge after any byte, then the slave transmitter must release the SDA line to let the master generate the Stop condition.

2.1.5 Data

After the first byte containing the address, all bytes that follow are data bytes. Each byte must be followed by an acknowledge bit. Data is transferred MSB-first.

2.1.6 Stop Condition

Generated by the master. The bus is considered to be free after the Stop condition is generated. The Stop condition occurs if while the SCL line is High, there is a Low-to-High transition of the SDA line.

The I²C interface serves the function of configuring the MVTX2801AG at boot time. The master is the MVTX2801AG, and the slave is the EEPROM memory.

2.2 Synchronous Serial Interface

The synchronous serial interface serves the function of configuring the MVTX2801AG not at boot time but via a PC. The PC serves as master and the MVTX2801AG serves as slave. The protocol for the synchronous serial interface is nearly identical to the I²C protocol. The main difference is that there is no acknowledgment bit after each byte of data transferred.

The unmanaged MVTX2801AG uses a synchronous serial interface to program the internal registers. To reduce the number of signals required, the register address, command and data are shifted in serially through the PS_DO pin. PS_STROBE- pin is used as the shift clock. PS_DI- pin is used as data return path.

Each command consists of four parts.

- START pulse
- Register Address
- Read or Write command
- Data to be written or read back

Any command can be aborted in the middle by sending an ABORT pulse to the MVTX2801AG.

A START command is detected when PS_DO is sampled high at PS_STROBE - leading edge, and PS_DO is sampled low when STROBE- falls.

An ABORT command is detected when PS_DO is sampled low at PS_STROBE - leading edge, and PS_DO is sampled high when PS_STROBE - falls.

2.2.1 Write Command

Figure 3 - Write Command

2.2.2 Read Command

Figure 4 - Read Command

All registers in the MVTX2801AG can be modified through this synchronous serial interface.

3.0 Data Forwarding Protocol

3.1 Unicast Data Frame Forwarding

When a frame arrives, it is assigned a handle in memory by the Frame Control Buffer Manager (FCB Manager). An FCB handle will always be available, because of advance buffer reservations.

The memory (ZBT-SRAM) interface is a 64-bit bus, connected to a ZBT-SRAM domain. The Receive DMA (RxDMA) is responsible for multiplexing the data and the address. On a port's "turn," the RxDMA will move 8 bytes (or up to the end-of-frame) from the port's associated Rx FIFO into memory (Frame Data Buffer, or FDB).

Once an entire frame has been moved to the FDB, and a good end-of-frame (EOF) has been received, the Rx interface makes a switch request. The RxDMA arbitrates among multiple switch requests.

The switch request consists of the first 64 bytes of a frame, containing among other things, the source and destination MAC addresses of the frame. The search engine places a switch response in the switch response queue of the frame engine when done. Among other information, the search engine will have resolved the destination port of the frame and will have determined that the frame is unicast.

After processing the switch response, the Transmission Queue Manager (TxQ manager) of the frame engine is responsible for notifying the destination port that it has a frame to forward to it. But first, the TxQ manager has to decide whether or not to drop the frame, based on global FDB reservations and usage, as well as TxQ occupancy at the destination. If the frame is not dropped, then the TxQ manager links the frame's FCB to the correct per-port-per-class TxQ. Unicast TxQ's are linked lists of transmission jobs, represented by their associated frames' FCB's. There is one linked list for each transmission class for each port. There are 8 classes for each of the 4 Gigabit ports - a total of 32 unicast queues.

The TxQ manager is responsible for scheduling transmission among the queues representing different classes for a port. When the port control module determines that there is room in the MAC Transmission FIFO (Tx FIFO) for another frame, it requests the handle of a new frame from the TxQ manager. The TxQ manager chooses among the head-of-line (HOL) frames from the per-class queues for that port, using a Zarlink Semiconductor scheduling algorithm.

As at the transmit end, each of the 4 ports has time slots devoted solely to reading data from memory at the address calculated by port control. The Transmission DMA (TxDMA) is responsible for multiplexing the data and the address. On a port's turn, the TxDMA will move 8 bytes (or up to the EOF) from memory into the port's associated TxFIFO. After reading the EOF, the port control requests a FCB release for that frame. The TxDMA arbitrates among multiple buffer release requests.

The frame is transmitted from the TxFIFO to the line.

3.2 Multicast Data Frame Forwarding

After receiving the switch response, the TxQ manager has to make the dropping decision. A global decision to drop can be made, based on global FDB utilization and reservations. If so, then the FCB is released and the frame is dropped. In addition, a selective decision to drop can be made, based on the TxQ occupancy at some subset of the multicast packet's destinations. If so, then the frame is dropped at some destinations but not others, and the FCB is not released. If the frame is not dropped at a particular destination port, then the TxQ manager formats an entry in the multicast queue for that port and class. Multicast queues are physical queues (unlike the linked lists for unicast frames). There are 4 multicast queues for each of the 4 Gigabit ports.

During scheduling, the TxQ manager treats the unicast queue and the multicast queue of the same class as one logical queue.

The port control requests a FCB release only after the EOF for the multicast frame has been read by all ports to which the frame is destined.

4.0 Memory Interface

4.1 Overview

The figure below illustrates the first part of the ZBT-SRAM interface for the MVTX2801AG. As shown, a 64 bit bus ZBT-SRAM bank A is used for Tx/RxDMA access. Because the clock frequency is 133 MHz, the total memory bandwidth is 64-bits x 133 MHz = 8.5 Gbps, for frame data buffer (FDB) access.

Figure 5 - SRAM Interface Block Diagram (DMAs for Gigabit Ports)

4.2 Detailed Memory Information

Because the memory bus is 64 bits wide, frames are broken into 8-byte granules, written to and read from each memory access. In the worst case, a 1-byte-long EOF granule gets written to memory Bank. This means that a 7-byte segment of memory bus is idle. The scenario results in a maximum 7 bytes of waste per frame, which is always acceptable because the interframe gap is 20 bytes.

5.0 Search Engine

5.1 Search Engine Overview

The MVTX2801AG search engine is optimized for high throughput searching, with enhanced features to support:

- Up to 64K MAC addresses
- 4 groups of port trunking
- Traffic classification into 8 transmission priorities, and 2 drop precedence levels

5.2 Basic Flow

Shortly after a frame enters the MVTX2801AG and is written to the Frame Data Buffer (FDB), the frame engine generates a Switch Request, which is sent to the search engine. The switch request consists of the first 64 bytes of the frame, which contain all the necessary information for the search engine to perform its task. When the search engine is done, it writes to the Switch Response Queue, and the frame engine uses the information provided in that queue for scheduling and forwarding.

In performing its task, the search engine extracts and compresses the useful information from the 64-byte switch request. Among the information extracted are the source and destination MAC addresses, the transmission and discard priorities, whether the frame is unicast or multicast. Requests are sent to the external SRAM Switch Database to locate the associated entries in the external MCT table.

When all the information has been collected from external SRAM, the search engine has to compare the MAC address on the current entry with the MAC address for which it is searching. If it is not a match, the process is repeated on the internal MCT Table. All MCT entries other than the first of each linked list are maintained internal to the chip. If the desired MAC address is still not found, then the result is either learning (source MAC address unknown) or flooding (destination MAC address unknown).

If the destination MAC address belongs to a port trunk, then the trunk number is retrieved instead of the port number. But on which port of the trunk will the frame be transmitted? This is easily computed using a hash of the source and destination MAC addresses.

When all the information is compiled, the switch response is generated, as stated earlier.

5.3 Search, Learning, and Aging

5.3.1 MAC Search

The search block performs source MAC address and destination MAC address searching. As we indicated earlier, if a match is not found, then the next entry in the linked list must be examined, and so on until a match is found or the end of the list is reached.

In port based VLAN mode, a bitmap is used to determine whether the frame should be forwarded to the outgoing port. The bitmap is not dynamic. Ports cannot enter and exit groups dynamically.

The MAC search block is also responsible for updating the source MAC address timestamp, used for aging.

5.3.2 Learning

The learning module learns new MAC addresses and performs port change operations on the MCT database. The goal of learning is to update this database as the networking environment changes over time. Learning and port change will be performed based on memory slot availability only.

5.3.3 Aging

Aging time is controlled by register 400h and 401h.

The aging module scans and ages MCT entries based on a programmable “age out” time interval. As we indicated earlier, the search module updates the source MAC address and VLAN port association timestamps for each frame it processes. When an entry is ready to be aged, the entry is removed from the table.

5.3.4 Data Structure

The MCT data structure is used for searching for MAC addresses. The structure is maintained by hardware in the search engine. The database is essentially a hash table, with collisions resolved by chaining. The database is partially external, and partially internal, as described earlier: the first MCT entry of each linked list is always located in the external SRAM, and the subsequent MCTs are located internally.

6.0 Frame Engine

6.1 Data Forwarding Summary

- Enters the device at the RxMAC, the RxDMA will move the data from the MAC RxFIFO to the FDB. Data is moved in 8-byte granules in conjunction with the scheme for the SRAM interface.
- A switch request is sent to the Search Engine. The Search Engine processes the switch request.
- A switch response is sent back to the Frame Engine and indicates whether the frame is unicast or multicast, and its destination port or ports.
- A Transmission Scheduling Request is sent in the form of a signal notifying the TxQ manager. Upon receiving a Transmission Scheduling Request, the device will format an entry in the appropriate Transmission Scheduling Queue (TxSch Q) or Queues. There are 8 TxSch Queues for each Gigabit port, one for each priority. Creation of a queue entry either involves linking a new job to the appropriate linked list if unicast, or adding an entry to a physical queue if multicast.
- When the port is ready to accept the next frame, the TxQ manager will get the head-of-line (HOL) entry of one of the TxSch Qs, according to the transmission scheduling algorithm (so as to ensure per-class quality of service). The unicast linked list and the multicast queue for the same port-class pair are treated as one logical queue.
- The TxDMA will pull frame data from the memory and forward it granule-by-granule to the MAC TxFIFO of the destination port.

6.2 Frame Engine Details

This section briefly describes the functions of each of the modules of the MVTX2801AG frame engine.

6.2.1 FCB Manager

The FCB manager allocates FCB handles to incoming frames, and releases FCB handles upon frame departure. The FCB manager is also responsible for enforcing buffer reservations and limits. The default values can be determined by referring to Chapter 8. In addition, the FCB manager is responsible for buffer aging, and for linking unicast forwarding jobs to their correct TxSch Q. The buffer aging can be enabled or disabled by the bootstrap pin and the aging time is defined in register FCBAT.

6.2.2 Rx Interface

The Rx interface is mainly responsible for communicating with the RxMAC. It keeps track of the start and end of frame and frame status (good or bad). Upon receiving an end of frame that is good, the Rx interface makes a switch request.

6.2.3 RxDMA

The RxDMA arbitrates among switch requests from each Rx interface. It also buffers the first 64 bytes of each frame for use by the search engine when the switch request has been made.

6.2.4 TxQ Manager

First, the TxQ manager checks the per-class queue status and global Reserved resource situation, and using this information, makes the frame dropping decision after receiving a switch response. If the decision is not to drop, the TxQ manager requests that the FCB manager link the unicast frame's FCB to the correct per-port-per-class TxQ. If multicast, the TxQ manager writes to the multicast queue for that port and class. The TxQ manager can also trigger source port flow control for the incoming frame's source if that port is flow control enabled. Second, the TxQ manager handles transmission scheduling; it schedules transmission among the queues representing different classes for a port. Once a frame has been scheduled, the TxQ manager reads the FCB information and writes to the correct port control module.

6.3 Port Control

The port control module calculates the SRAM read address for the frame currently being transmitted. It also writes start of frame information and an end of frame flag to the MAC TxFIFO. When transmission is done, the port control module requests that the buffer be released.

6.4 TxDMA

The TxDMA multiplexes data and address from port control, and arbitrates among buffer release requests from the port control modules.

7.0 Quality of Service and Flow Control

7.1 Model

Quality of service (QoS) is an all-encompassing term for which different people have different interpretations. In this chapter, by quality of service assurances, we mean the allocation of chip resources so as to meet the latency and bandwidth requirements associated with each traffic class. We do not presuppose anything about the offered traffic pattern. If the traffic load is light, then ensuring quality of service is straightforward. But if the traffic load is heavy, the MVTX2801AG must intelligently allocate resources so as to assure quality of service for high priority data.

We assume that the network manager knows his applications, such as voice, file transfer, or web browsing, and their relative importance. The manager can then subdivide the applications into classes and set up a service contract with each. The contract may consist of bandwidth or latency assurances per class. Sometimes it may even reflect an estimate of the traffic mix offered to the switch, though this is not required.

The table below shows examples of QoS applications with eight transmission priorities, including best effort traffic for which we provide no bandwidth or latency assurances.

Class	Example Assured Bandwidth (user defined)	Low Drop Subclass (If class is oversubscribed, these packets are the last to be dropped.)	High Drop Subclass (If class is oversubscribed, these packets are the first to be dropped.)
Highest transmission priorities, P7 Latency < 200 ms	300 Mbps	Sample application: control information	
Highest transmission priorities, P6 Latency < 200 ms	200 Mbps	Sample applications: phone calls; circuit emulation	Sample application: training video; other multimedia
Middle transmission priorities, P5 Latency < 400 ms	125 Mbps	Sample application: interactive activities	Sample application: non-critical interactive activities
Middle transmission priorities, P4 Latency < 800 ms	250 Mbps	Sample application: web business	
Low transmission priorities, P3 Latency < 1600 ms	80 Mbps	Sample application: file backups	
Low transmission priorities, P2 Latency < 3200 ms	45 Mbps	Sample application: email	Sample application: web research
Best effort, P1-P0	-	Sample application: casual web browsing	
TOTAL	1 Gbps		

Table 1 - Two-dimensional World Traffic

It is possible that a class of traffic may attempt to monopolize system resources by sending data at a rate in excess of the contractually assured bandwidth for that class. A well-behaved class offers traffic at a rate no greater than the agreed-upon rate. By contrast, a misbehaving class offers traffic that exceeds the agreed-upon rate. A misbehaving class is formed from an aggregation of misbehaving microflows. To achieve high link utilization, a misbehaving class is allowed to use any idle bandwidth. However, the quality of service (QoS) received by well-behaved classes must never suffer.

As Table 1 illustrates, each traffic class may have its own distinct properties and applications. As shown, classes may receive bandwidth assurances or latency bounds. In the example, P7, the highest transmission class, requires that all frames be transmitted within 0.2 ms, and receives 30% of the 1 Gbps of bandwidth at that port.

Best-effort (P1-P0) traffic forms a lower tier of service that only receives bandwidth when none of the other classes have any traffic to offer.

In addition, each transmission class has two subclasses, high-drop and low-drop. Well-behaved users should not lose packets. But poorly behaved users, users who send data at too high a rate, will encounter frame loss, and the first to be discarded will be high-drop. Of course, if this is insufficient to resolve the congestion, eventually some low-drop frames are dropped as well.

Table 1 shows that different types of applications may be placed in different boxes in the traffic table. For example, web search may fit into the category of high-loss, high-latency-tolerant traffic, whereas VoIP fits into the category of low-loss, low-latency traffic.

7.2 Four QoS Configurations

There are four basic pieces to QoS scheduling in the MVTX2801AG: strict priority (SP), delay bound, weighted fair queuing (WFQ), and best effort (BE). Using these four pieces, there are four different modes of operation, as shown in Table 2.

	P7	P6	P5	P4	P3	P2	P1	P0
Op1 (default)	Delay Bound						BE	
Op2	SP		Delay Bound				BE	
Op3	SP		WFQ					
Op4	WFQ							

Table 2 - Four QoS configurations per port

The default configuration is six delay-bounded queues and two best-effort queues. The delay bounds per class are 0.16 ms for P7 and P6, 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2. Best effort traffic is only served when there is no delay-bounded traffic to be served. P1 has strict priority over P0.

We have a second configuration in which there are two strict priority queues, four delay bounded queues, and two best effort queues. The delay bounds per class are 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2. If the user is to choose this configuration, it is important that P7-P6 (SP) traffic be either policed or implicitly bounded (e.g. if the incoming SP traffic is very light and predictably patterned). Strict priority traffic, if not admission-controlled at a prior stage to the MVTX2801AG, can have an adverse effect on all other classes' performance. P7 and P6 are both SP classes, and P7 has strict priority over P6.

The third configuration contains two strict priority queues and six queues receiving a bandwidth partition via WFQ. As in the second configuration, strict priority traffic needs to be carefully controlled.

In the fourth configuration, all queues are served using a WFQ service discipline

7.3 Delay Bound

In the absence of a sophisticated QoS server and signaling protocol, the MVTX2801AG may not be assured of the mix of incoming traffic ahead of time. To cope with this uncertainty, our delay assurance algorithm dynamically adjusts its scheduling and dropping criteria, guided by the queue occupancies and the due dates of their head-of-line (HOL) frames. As a result, we assure latency bounds for all admitted frames with high confidence, even in the presence of system-wide congestion. Our algorithm identifies misbehaving classes and intelligently discards

frames at no detriment to well-behaved classes. Our algorithm also differentiates between high-drop and low-drop traffic with a weighted random early drop (WRED) approach. Random early dropping prevents congestion by randomly dropping a percentage of high-drop frames even before the chip's buffers are completely full, while still largely sparing low-drop frames. This allows high-drop frames to be discarded early, as a sacrifice for future low-drop frames. Finally, the delay bound algorithm also achieves bandwidth partitioning among classes.

7.4 Strict Priority and Best Effort

When strict priority is part of the scheduling algorithm, if a queue has even one frame to transmit, it goes first. Two of our four QoS configurations include strict priority queues. The goal is for strict priority classes to be used for IETF expedited forwarding (EF), where performance guarantees are required. As we have indicated, it is important that strict priority traffic be either policed or implicitly bounded, so as to keep from harming other traffic classes.

When best effort is part of the scheduling algorithm, a queue only receives bandwidth when none of the other classes have any traffic to offer. Two of our four QoS configurations include best effort queues. The goal is for best effort classes to be used for non-essential traffic, because we provide no assurances about best effort performance. However, in a typical network setting, much best effort traffic will indeed be transmitted, and with an adequate degree of expediency.

Because we do not provide any delay assurances for best effort traffic, we do not enforce latency by dropping best effort traffic. Furthermore, because we assume that strict priority traffic is carefully controlled before entering the MVTX2801AG, we do not enforce a fair bandwidth partition by dropping strict priority traffic. To summarize, dropping to enforce quality of service (i.e. bandwidth or delay) does not apply to strict priority or best effort queues. We only drop frames from best effort and strict priority queues when global buffer resources become scarce.

7.5 Weighted Fair Queuing

In some environments - for example, in an environment in which delay assurances are not required, but precise bandwidth partitioning on small time scales is essential (WFQ may be preferable to a delay-bounded scheduling discipline). The MVTX2801AG provides the user with a WFQ option with the understanding that delay assurances cannot be provided if the incoming traffic pattern is uncontrolled. The user sets eight WFQ "weights" such that all weights are whole numbers and sum to 64. This provides per-class bandwidth partitioning with error within 2%.

In WFQ mode, though we do not assure frame latency, the MVTX2801AG still retains a set of dropping rules that helps to prevent congestion and trigger higher level protocol end-to-end flow control.

As before, when strict priority is combined with WFQ, we do not have special dropping rules for the strict priority queues, because the input traffic pattern is assumed to be carefully controlled at a prior stage. However, we do indeed drop frames from SP queues for global buffer management purposes. In addition, queues P1 and P0 are treated as best effort from a dropping perspective, though they still are assured a percentage of bandwidth from a WFQ scheduling perspective. What this means is that these particular queues are only affected by dropping when the global buffer count becomes low.

7.6 Shaper

Although traffic shaping is not a primary function of the MVTX2801AG, the chip does implement a shaper for expedited forwarding (EF). Our goal in shaping is to control the peak and average rate of traffic exiting the MVTX2801AG. Shaping is limited to class P6 (the second highest priority). This means that class P6 will be the class used for EF traffic. (By contrast, we assume class P7 will be used for control packets only.) If shaping is enabled for P6, then P6 traffic must be scheduled using strict priority. With reference to Table 2, only the middle two QoS configurations may be used.

Peak rate is set using a programmable whole number, no greater than 64 (register QOS-CREDIT_C6_Gn). For example, if the setting is 32, then the peak rate for shaped traffic is $32/64 \times 1000 \text{ Mbps} = 500 \text{ Mbps}$. Average rate is also a programmable whole number, no greater than 64, and no greater than the peak rate. For example, if the setting is 16, then the average rate for shaped traffic is $(16/64) \times 1000 \text{ Mbps} = 250 \text{ Mbps}$. As a consequence of the

above settings in our example, shaped traffic will exit the MVTX2801AG at a rate always less than 500 Mbps, and averaging no greater than 250 Mbps.

Also, when shaping is enabled, it is possible for a P6 queue to explode in length if fed by a greedy source. The reason is that a shaper is by definition not work-conserving; that is, it may hold back from sending a packet even if the line is idle. Though we do have global resource management, we do nothing to prevent this situation locally. We assume SP traffic is policed at a prior stage to the MVTX2801AG.

7.7 WRED Drop Threshold Management Support

To avoid congestion, the Weighted Random Early Detection (WRED) logic drops packets according to specified parameters. The following table summarizes the behavior of the WRED logic.

	P7	P6	P5	P4	P3	P2	High Drop	Low Drop
Level 1 $N \geq 240$	$ P7 \geq A$ KB	$ P6 \geq B$ KB	$ P5 \geq C$ KB	$ P4 \geq D$ KB	$ P3 \geq E$ KB	$ P2 \geq F$ KB	X%	0%
Level 2 $N \geq 280$							Y%	Z%
Level 3 $N \geq 320$							100%	100%

Table 3 - WRED Dropping Scheme

In the table, $|P_x|$ is the byte count in queue P_x . The WRED logic has three drop levels, depending on the value of N , which is based on the number of bytes in the priority queues. If delay bound scheduling is used, N equals $16|P7| + 16|P6| + 8|P5| + 4|P4| + 2|P3| + |P2|$. If WFQ scheduling is used, N equals $|P7| + |P6| + |P5| + |P4| + |P3| + |P2|$. Each drop level has defined high-drop and low-drop percentages, which indicate the percentage of high-drop and low-drop packets that will be dropped at that level. The X, Y, and Z percent parameters can be programmed using the registers RDRC0 and RDRC1. Parameters A-F are the byte count thresholds for each priority queue, and are also programmable. When using delay bound scheduling, the values selected for A-F also control the approximate bandwidth partition among the traffic classes; see application note.

7.8 Buffer Management

Because the number of frame data buffer (FDB) slots is a scarce resource, and because we want to ensure that one misbehaving source port or class cannot harm the performance of a well-behaved source port or class, we introduce the concept of buffer management into the MVTX2801AG. Our buffer management scheme is designed to divide the total buffer space into numerous reserved regions and one shared pool (see Figure 6).

As shown in the figure, the FDB pool is divided into several parts. A reserved region for temporary frames stores frames prior to receiving a switch response. Such a temporary region is necessary, because when the frame first enters the MVTX2801AG, its destination port and class are as yet unknown, and so the decision to drop or not needs to be temporarily postponed. This ensures that every frame can be received first before subjecting it to the frame drop discipline after classifying.

Six reserved sections, one for each of the highest six priority classes, ensure a programmable number of FDB slots per class. The lowest two classes do not receive any buffer reservation.

Another segment of the FDB reserves space for each of the 4 ports. These source port buffer reservations are programmable. These 8 reserved regions make sure that no well-behaved source port can be blocked by another misbehaving source port.

In addition, there is a shared pool, which can store any type of frame. The registers related to the Buffer Management logic are:

- PRG- Port Reservation for Gigabit Ports
- SFCB- Share FCB Size
- C2RS- Class 2 Reserved Size
- C3RS- Class 3 Reserved Size
- C4RS- Class 4 Reserved Size
- C5RS- Class 5 Reserved Size
- C6RS- Class 6 Reserved Size
- C7RS- Class 7 Reserved Size

Figure 6 - Buffer Partition Scheme Used in the MVTX2801AG

7.8.1 Dropping When Buffers Are Scarce

Summarizing the two examples of local dropping discussed earlier in this chapter:

- If a queue is a delay-bounded queue, we have a multilevel WRED drop scheme, designed to control delay and partition bandwidth in case of congestion.
- If a queue is a WFQ-scheduled queue, we have a multilevel WRED drop scheme, designed to prevent congestion.

In addition to these reasons for dropping, the MVTX2801AG also drops frames when global buffer space becomes scarce. The function of buffer management is to ensure that such droppings cause as little blocking as possible.

7.9 Flow Control Basics

Because frame loss is unacceptable for some applications, the MVTX2801AG provides a flow control option. When flow control is enabled, scarcity of buffer space in the switch may trigger a flow control signal; this signal tells a source port, sending a packet to this switch, to temporarily hold off.

While flow control offers the clear benefit of no packet loss, it also introduces a problem for quality of service. When

a source port receives an Ethernet flow control signal, all microflows originating at that port, well-behaved or not, are halted. A single packet destined for a congested output can block other packets destined for uncongested outputs. The resulting head-of-line blocking phenomenon means that quality of service cannot be assured with high confidence when flow control is enabled.

In the MVTX2801AG, each source port can independently have flow control enabled or disabled. For flow control enabled ports, by default all frames are treated as lowest priority during transmission scheduling. This is done so that those frames are not exposed to the WRED Dropping scheme. Frames from flow control enabled ports feed to only one queue at the destination, the queue of lowest priority. What this means is that if flow control is enabled for a given source port, then we can guarantee that no packets originating from that port will be lost, but at the possible expense of minimum bandwidth or maximum delay assurances. In addition, these “downgraded” frames may only use the shared pool or the per-source reserved pool in the FDB; frames from flow control enabled sources may not use reserved FDB slots for the highest six classes (P2-P7).

The MVTX2801AG does provide a system-wide option of permitting normal QoS scheduling (and buffer use) for frames originating from flow control enabled ports. When this programmable option is active, it is possible that some packets may be dropped, even though flow control is on. The reason is that intelligent packet dropping is a major component of the MVTX2801AG's approach to ensuring bounded delay and minimum bandwidth for high priority flows.

7.9.1 Unicast Flow Control

For unicast frames, flow control is triggered by source port resource availability. Recall that the MVTX2801AG's buffer management scheme allocates a reserved number of FDB slots for each source port. If a programmed number of a source port's reserved FDB slots have been used, then flow control Xoff is triggered. Xon is triggered when a port is currently being flow controlled, and all of that port's reserved FDB slots have been released.

Note that the MVTX2801AG's per-source-port FDB reservations assure that a source port that sends a single frame to a congested destination will not be flow controlled.

7.9.2 Multicast Flow Control

When port based Vlan is not used, a global buffer counter (64 packets) triggers flow control for multicast frames. When the system exceeds a programmable threshold of multicast packets, Xoff is triggered. Xon is triggered when the system returns below this threshold. MCC register programs the threshold. When port based Vlan is used, each Vlan has a global buffer counter.

In addition, each source port has an 8-bit port map recording which port or ports of the multicast frame's fanout were congested at the time Xoff was triggered. All ports are continuously monitored for congestion, and a port is identified as uncongested when its queue occupancy falls below a fixed threshold. When all those ports that were originally marked as congested in the port map have become uncongested, then Xon is triggered, and the 8-bit vector is reset to zero.

The MVTX2801AG also provides the option of disabling VLAN multicast flow control.

Note: If port flow control is on, QoS performance will be affected. To determine the most efficient way to program, please refer to the QoS Application Note.

7.10 Mapping to IETF Diffserv Classes

The mapping between priority classes discussed in this chapter and elsewhere is shown below.

MVTX2801AG	P7	P6	P5	P4	P3	P2	P1	P0
IETF	NM	EF	AF0	AF1	AF2	AF3	BE0	BE1

Table 4 - Mapping between MVTX2801AG and IETF Diffserv Classes for Gigabit Ports

As the table illustrates, P7 is used solely for network management (NM) frames. P6 is used for expedited forwarding service (EF). Classes P2 through P5 correspond to an assured forwarding (AF) group of size 4. Finally, P0 and P1 are two best effort (BE) classes.

Features of the MVTX2801AG that correspond to the requirements of their associated IETF classes are summarized in the table below.

Network management (NM) and Expedited forwarding (EF)	- Global buffer reservation for NM and EF - Shaper for EF traffic - Option of strict priority scheduling - No dropping if admission controlled
Assured forwarding (AF)	- Four AF classes - Programmable bandwidth partition, with option of WFQ service - Option of delay-bounded service keeps delay under fixed levels even if not admission-controlled - Random early discard, with programmable levels - Global buffer reservation for each AF class
Best effort (BE)	- Two BE classes - Service only when other queues are idle means that QoS not adversely affected - Random early discard, with programmable levels - Traffic from flow control enabled ports automatically classified as BE

Table 5 - MVTX2801AG Features Enabling IETF Diffserv Standards

8.0 Port Trunking**8.1 Features and Restrictions**

A port group (i.e. trunk) can include up to 4 physical ports, but all of the ports in a group must be in the same MVTX2801AG.

The MVTX2801AG provides several pre-assigned trunk group options, containing as many as 4 ports per group, or alternatively, as many as 4 total groups.

Load distribution among the ports in a trunk for unicast is performed using hashing based on source MAC address and destination MAC address. The other options include source MAC address only, destination MAC address only. Load distribution for multicast is performed similarly.

If a VLAN includes any of the ports in a trunk group, all the ports in that trunk group should be in the same VLAN member map.

The MVTX2801AG also provides a safe fail-over mode for port trunking automatically. If one of the ports in the trunking group goes down, the MVTX2801AG will automatically redistribute the traffic over to the remaining ports in the trunk in unmanaged mode. In managed mode, the software can perform similar tasks.

8.2 Unicast Packet Forwarding

The search engine finds the destination MCT entry, and if the status field says that the destination address found belongs to a trunk, then the group number is retrieved instead of the port number. In addition, if the source address belongs to a trunk, then the source port's trunk membership register is checked to determine if the address has moved.

A hash key is used to determine the appropriate forwarding port, based on some combination of the source and destination MAC addresses for the current packet.

The search engine retrieves the VLAN member ports from the VLAN index table, which consists of 4K entries.

The search engine retrieves the VLAN member ports from the ingress port's VLAN map. Based on the destination MAC address, the search engine determines the egress port from the MCT database. If the egress port is a member of a trunk group, the packet can be distributed to the other members of that trunk group. The VLAN map is used to check whether the egress port is a member of the VLAN, based on the ingress port. If it is a member, the packet is forwarded otherwise it is discarded.

8.3 Multicast Packet Forwarding

For multicast packet forwarding, the device must determine the proper set of ports from which to transmit the packet based on the VLAN index and hash key.

Two functions are required in order to distribute multicast packets to the appropriate destination ports in a port trunking environment.

- Determining one forwarding port per group.
- For multicast packets, all but one port per group, the forwarding port, must be excluded.

8.4 Preventing Multicast Packets from Looping Back to the Source Trunk

The search engine needs to prevent a multicast packet from sending to a port that is in the same trunk group with the source port. This is because, when we select the primary forwarding port for each group, we do not take the source port into account. To prevent this, we simply apply one additional filter, so as to block that forwarding port for this multicast packet.

9.0 LED Interface

9.1 Introduction

The MVTX2801AG LED block provides two interfaces: a serial output channel, and a parallel time-division interface. The serial output channel provides port status information from the MVTX2801AG chip in a continuous serial stream. This means that a low cost external device must be used to decode the serial data and to drive an LED array for display.

By contrast, the parallel time-division interface supports a glueless LED module. Indeed, the parallel interface can directly drive low-current LEDs without any extra logic. The pin LED_PM is used to select serial or parallel mode.

For some LED signals, the interface also provides a blinking option. Blinking may be enabled for LED signals TxD, RxD, COL, and FC (to be described later). The pin LED_BLINK is used to enable blinking, and the blinking frequency is around 160 ms.

9.2 Serial Mode

In serial mode, the following pins are utilized:

- LED_SYNCO - a sync pulse that defines the boundary between status frames
- LED_CLKO - the clock signal
- LED_DO - a continuous serial stream of data for all status LEDs that repeats once every frame time

In each cycle (one frame of status information, or one sync pulse), 16x8 bits of data are transmitted on the LED_DO signal. The sequence of transmission of data bits is as shown in the figure below:

Figure 7 - Timing diagram for serial mode in LED interface.

The status bits shown in here are flow control (FC), transmitting data (TxD), receiving data (RxD), link up (LNK), speed (SP0 and SP1), full duplex (FDX), and collision (COL). Note that SP[1:0] is defined as 10 for 1 Gbps, 01 for 100 Mbps, and 00 for 10 Mbps.

Also note that U0-U7 represent user-defined sub-frames in which additional status information may be embedded. We will see later that the MVTX2801AG provides registers that can be written by the CPU to indicate this additional status information as it becomes available.

9.3 Parallel Mode

In parallel mode, the following pins are utilized:

- LED_PORT_SEL[3:0] - indicates which of the 4 Gigabit port status bytes is being read out
- LED_PORT_SEL[7:4] - No use.
- LED_PORT_SEL[9:8] - indicates which of the 2 user-defined status bytes is being read out
- LED_BYTEOUT_[7:0] - provides 8 bits for 4 different port status indicators. Note that these bits are active low.

By default, the system is in parallel mode. In parallel mode, the 10 status bytes are scanned in a continuous loop, with one byte read out per clock cycle, and the appropriate port select bit asserted.

9.4 LED Control Registers

An LED Control Register can be used for programming the LED clock rate, sample hold time, and pattern in parallel mode.

In addition, the MVTX2801AG provides 8 registers called LEDUSER[7:0] for user-defined status bytes. During operation, the CPU can write values to these registers, which will be read out to the LED interface output (serial or parallel). Only LEDUSER[1:0] are used in parallel mode. The content of the LEDUSER registers will be sent out by the LED serial shift logic, or in parallel mode, a byte at a time.

Because in parallel mode there are only two user-defined registers, LEDUSER[7:2] is shared with LEDSIG[7:2].

For LEDSIG[j], where j = 2, 3, ..., 6, the corresponding register is used for programming the LED pin LED_BYTEOUT_[j]. The format is as follows:

7	4	3	0
COL	FDX	SP1	SP0

Bits [3:0] Signal polarity:
 0: do not invert polarity (high true)
 1: invert polarity

Bits [7:4] Signal select:
 0: do not select
 1: select the corresponding bit

For j = 2, 3, ..., 5, the value of LED_BYTEOUT_[j] equals the logical AND of all selected bits. For j = 6, the value is equal to the logical OR. Therefore, the programmable LEDSIG[5:2] registers allow any conjunctive formula including any of the 4 status bits (COL, FDX, SP1, SP0) or their negations to be sent to the LED_BYTEOUT_[5:2] pins. Similarly, the programmable LEDSIG[6] register allows any disjunctive formula including any of the 4 status bits or their negations to be sent to pin LED_BYTEOUT_[6].

LEDSIG[7] is used for programming both LED_BYTEOUT_[1] and LED_BYTEOUT_[0]. As we will see, it has other functions as well. The format is as follows:

7			4		3		0
GP	RxD	TxD	FC	P6	RxD	TxD	FC

- Bits [7]
- Global output polarity: this bit controls the output polarity of all LED_BYTEOUT_ and LED_PORT_SEL pins. **(Default 0)**
 - 0: do not invert polarity (LED_BYTEOUT_[7:0] are high activated; LED_PORT_SEL[9:0] are low activated)
 - 1: invert polarity (LED_BYTEOUT_[7:0] are low activated; LED_PORT_SEL[9:0] are high activated)
- Bits [6:4]
- Signal select:
 - 0: do not select
 - 1: select the corresponding bit
 - The value of LED_BYTEOUT_[1] equals the logical OR of all selected bits. **(Default 110)**
- Bit [3]
- Polarity control of LED_BYTEOUT_[6] **(Default 0)**
 - 0: do not invert
 - 1: invert
- Bits [2:0]
- Signal select:
 - 0: do not select
 - 1: select the corresponding bit
 - The value of LED_BYTEOUT_[0] equals the logical OR of all selected bits. **(Default 001)**

10.0 Register Definition**10.1 Register Description**

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
0. ETHERNET Port Control Registers - Substitute [N] with Port number (0..7)						
ECR1P"N"	Port Control Register 1 for Port N (N=0-7)	000 + 2N	R/W	000+2N	c0	
ECR2P"N"	Port Control Register 2 for Port N (N=0-7)	001 + 2N	R/W	001+2N	00

Table 6 - MVTX2801AG Register Description (continued)

- Note:**
1. se = Search Engine
 2. fe = Frame Engine
 3. pgs = Port Group01, 23, 45, and 67
 4. mc = MAC Control
 5. tm = timer

10.2 Group 0 Address - MAC Ports Group

10.2.1 ECR1Pn: Port N Control Register

I²C Address h00+2n; Serial Interface Address: h000+2n (n=0 to 7) (For the 2600 it is different)

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
Sp State		A-FC	Port Mode				

- Bit [4:0] • Port Mode **(Default 2'b00)**
- Bit [4:3] - 00 - Automatic Enable Auto-Negotiation - This enables hardware state machine for auto-negotiation.
 - 01 - Limited Disable auto-Negotiation - This disables hardware for speed auto-negotiation. Hardware Polls MII for link status.
 - 10 - Link Down - Force link down (disable the port). Does not talk to PHY.
 - 11 - Link Up - Does not talk to PHY. User ERC1 [2:0] for config.
- Bit [2] - 1 - 10Mbps **(Default 1'b0)**
 - 0 - 100Mbps
 • Bit 2 is used only when the port is in MII (10/100) mode.
- Bit [1] - 1 - Half Duplex (Do not use) **(Default 1'b0)**
 - 0 - Full Duplex
- Bit [0] - 1 - Flow Control Off **(Default 1'b0)**
 - 0 - Flow Control On
 • When flow control is on:
 • In full duplex mode, the MAC transmitter sends Flow Control Frames when necessary. The MAC receiver interprets and processes incoming flow control frames. The Flow Control Frame Received counter is incremented whenever a flow control frame is received.
 • When flow control is off:
 • In full duplex mode, the MAC transmitter does not send flow control frames. The MAC receiver does not interpret or process the flow control frames. The Flow Control Frame Receiver counter is not incremented.
- Bit [5] • Asymmetric Flow Control Enable.
 - 0 - Disable asymmetric flow control
 - 1 - Enable asymmetric flow control
 • When this bit is set, and flow control is on (bit[0] = 0), don't send out a flow control frame. But MAC Receiver interprets and process flow control frames. (Default is 0)
- Bit [7:6] - SS - Spanning tree state (802.1D spanning tree protocol). **(Default 2'b11)**
 - 00 - Blocking: Frame is dropped
 - 01 - Listening: Frame is dropped
 - 10 - Learning: Frame is dropped. Source MAC address is learned.
 - 11 - Forwarding: Frame is forwarded. Source MAC address is learned.

10.2.2 ECR2Pn: Port N Control Register

I²C Address: 01+2n; Serial Interface Address:h001+2n (n=0to7)

Accessed by serial interface (R/W)

7					0
Security En		RTsel	DisL	Ftf	Futf

- Bit[0]:
 - Filter untagged frame **(Default 0)**
 - 0: Disable
 - 1: Enable - All untagged frames from this port are discarded or follow security option when security is enable
- Bit[1]:
 - Filter Tag frame **(Default 0)**
 - 0: Disable
 - 1: Enable - All tagged frames from this port are discarded or follow security option when security is enable
- Bit[2]:
 - Learning Disable **(Default 0)**
 - 0: Learning is enabled on this port
 - 1: Learning is disabled on this port
- Bit[3]:
 - Reserved
- Bit [5:4:]
 - Reserved
- Bit[7:6]
 - Security Enable (Default 00). The MVTX2801AG checks the incoming data for one of the following conditions:
 - If the source MAC address of the incoming packet is in the MAC table and is defined as secure address but the ingress port is not the same as the port associated with the MAC address in the MAC table.
 - A MAC address is defined as secure when its entry at MAC table has static status and bit 0 is set to 1. MAC address bit 0 (the first bit transmitted) indicates whether the address is unicast or multicast. As source addresses are always unicast bit 0 is not used (always 0). MVTX2801 uses this bit to define secure MAC addresses.
 - If the port is set as learning disable and the source MAC address of the incoming packet is not defined in the MAC address table.
 - If the port is configured to filter untagged frames and an untagged frame arrives or if the port is configured to filter tagged frames and a tagged frame arrives.
 - If one of these three conditions occurs, the packet will be handled according to one of the following specified options:
 - 00 - Disable port security
 - 01 - Enable port security. Port will be disabled when security violation is detected
 - 10 - N/A
 - 11 - N/A

10.3 Group 1 Address - VLAN Group

10.3.1 AVTCL - VLAN Type Code Register Low

I²C Address h12; Serial Interface Address:h100

Accessed by serial interface and I²C (R/W)

- Bit[7:0]:
- VLANType_LOW: Lower 8 bits of the VLAN type code (Default 00)

10.3.2 AVTCH - VLAN Type Code Register High

I²C Address h13; Serial Interface Address:h101

Accessed by serial interface and I²C (R/W)

Bit [7:0] • VLANType_HIGH: Upper 8 bits of the VLAN type code (Default is 81)

10.3.3 PVMAP00_0 - Port 00 Configuration Register 0

I²C Address h14, Serial Interface Address:h102)

Accessed by serial interface and I²C (R/W)

Port Based VLAN Mode

This register indicates the legal egress ports. Example: A "1" on bit 3 means that packets arriving on port 0 can be sent to port 3. A "0" on bit 3 means that any packet destined to port 3 will be discarded.

Bit[3:0]: • VLAN Mask for ports 3 to 0 (Default F)
- 0 - Disable
- 1 - Enable

Bit[7:4]: • Reserve (Default F)

10.3.4 PVMAP00_1 - Port 00 Configuration Register 1

I²C Address h15, Serial Interface Address:h103

Accessed by serial interface and I²C (R/W)

Port Based VLAN Mode

Bit[0]: • VLAN Mask for ports 8 (Default 1'B1)
- 0 - Disable
- 1 - Enable

Bit[7:1]: • Reserved (Default is 7'B1111_111)

10.3.5 PVMAP00_2 - Port 00 Configuration Register 2

I²C Address h16, Serial Interface Address:h104

Accessed by serial interface and I²C (R/W)

This registered is unused

10.3.6 PVMAP00_3 - Port 00 Configuration Register 3I²C Address h17, Serial Interface Address:h105Accessed by serial interface and I²C (R/W)

Port Based Mode

7	6	5	3	2	1	0
FP en	Drop	Default TX priority	FNT	IF	Reserved	

Bit [1:0]: • Reserved (**Default 0**)

Bit [2]: • Force untagout (**Default 0**)

- 0 Disable
- 1 Force untag output

All packets transmitted from this port are untagged. This register is used when this port is connected to legacy equipment that does not support VLAN tagging.

Bit [5:3]: • Fixed Transmit priority. Used when bit[7] = 1 (**Default 0**)

- 000 Transmit Priority Level 0 (Lowest)
- 001 Transmit Priority Level 1
- 010 Transmit Priority Level 2
- 011 Transmit Priority Level 3
- 100 Transmit Priority Level 4
- 101 Transmit Priority Level 5
- 110 Transmit Priority Level 6
- 111 Transmit Priority Level 7 (Highest)

Bit [6]: • Fixed Discard priority (**Default 0**)

- 0 - Discard Priority Level 0 (Lowest)
- 1 - Discard Priority Level 7(Highest)

Bit [7]: • Enable Fix Priority (**Default 0**)

- 0 Disable fix priority. All frames are analysed. Transmit Priority and Drop Priority are based on VLAN Tag, TOS or Logical Port.
- 1 Transmit Priority and Discard Priority are based on values programmed in bit [6:3]

I²C Address: h038, Serial Interface Address:h126

Accessed by serial interface (R/W)

7			4	3	1	0
RO	MP	BPDU	DM	Reserved		Vmod

- Bit [0]:
 - Reserved
 - Must be '0'
- Bit [4]:
 - Disable MAC address 0
 - 0: MAC address 0 is not leaned.
 - 1: MAC address 0 is leaned.
- Bit [5]:
 - Force BPDU as multicast frame **(Default 0)**
 - 1: Enable. BPDU frames (frames with destination MAC address in the range of 01-80-C2 00-00-00 through 01-80-C2-00-00-0F) are forwarded as multicast frames.
 - 0: Disable. Drop frames in this range.
- Bit [6]:
 - MAC/PORT
 - 0: Single MAC address per system
 - 1: Single MAC address per port
- Bit [7]:
 - Reserved

10.4 Group 2 Address - Port Trunking Group

10.4.1 TRUNK0 - Trunk group 0 Member (Managed Mode Only)

Serial Interface Address:h200

Accessed by serial interface (R/W)

Bit [7:0] Reserved

10.4.2 TRUNK1 - Trunk group 1 Member (Managed Mode Only)

Serial Interface Address:h201

Accessed by serial interface (R/W)

Bit [7:0] Reserved

10.4.3 TRUNK2- Trunk group 2 Member (Managed Mode Only)

Serial Interface Address:h202

Accessed by serial interface (R/W)

Bit [7:0] Reserved

10.4.4 TRUNK3- Trunk group 3 Member (Managed Mode Only)

Serial Interface Address:h203

Accessed by serial interface and I²C (R/W)

Bit [7:0] Reserved

10.4.5 TRUNK_HASH_MODE - Trunk hash mode

Serial Interface Address:h206

Accessed by serial interface (R/W)

Bit [7:0] Reserved

10.4.6 TRUNK0_MODE - Trunk group 0 and 1 modeI²C Address: h039, Serial Interface Address:h207Accessed by serial interface and I²C (R/W)

Port Selection in unmanaged mode. Trunk group 0 and trunk group 1 are enable accordingly to bit [1:0] when input pin P_d[9] = 0 (external pull down).

- Bit [1:0]:
- Port member selection for Trunk 0 and 1 in unmanaged mode (Default 2'b00)
 - 00 - Only trunk group 0 is enable. Port 0 and 1 are used for trunk group0
 - 01 - Only trunk group 0 is enable. Port 0,1 and 2 are used for trunk group0
 - 10 - Only trunk group 0 is enable. Port 0,1,2 and 3 are used for trunk group0
 - 11 - Trunk group 0 and 1 are enable. Port 0, 1 used for trunk group0, and port 2 and 3 are used for trunk group1

10.4.7 TRUNK0_HASH0 - Trunk group 0 hash result 0,1,2 destination port number

Serial Interface Address:h208

Reserved

10.4.8 TRUNK0_HASH1 - Trunk group 0 hash result 2,3,4,5 destination port number

Serial Interface Address:h209

10.6 Group 4 Address - Search Engine Group**10.6.1 AGETIME_LOW - MAC address aging time Low**

I²C Address h03C; Serial Interface Address:h400

Accessed by serial interface and I²C (R/W)

Bit [7:0] Low byte of the MAC address aging timer. (Default 2c)

Mac address aging is enable/disable by boot strap T_d[9].

10.6.2 AGETIME_HIGH -MAC address aging time High

I²C Address h03D; Serial Interface Address h401

Accessed by serial interface and I²C (R/W)

Bit [7:0]: High byte of the MAC address aging timer. (Default 00)

Aging time is based on the following equation:

{AGETIME_TIME,AGETIME_LOW} X (# of MAC entries X100μsec)

Note: the number of entries= 66K when T_d[5] is pull down (SRAM memory size = 512K) and 34K when T_d[5] is pull up (SRAM memory size = 256K).

10.6.3 V_AGETIME - VLAN to Port aging time

Serial Interface Address h402

- select TOS bits for Drop **(Default 0)**
 - 0 - Use TOS [4:2] bits to map the drop priority
 - 1 - Use TOS [5:3] bits to map the drop priority
- 58
- SEMICMF.019

10.7.3 FCR - Flooding Control RegisterI²C Address h040; Serial Interface Address:h502Accessed by serial interface and I²C (R/W)

- Bit [3:0]:
- U2MR: Unicast to Multicast Rate. Units in terms of time base defined in bits [6:4]. This is used to limit the amount of flooding traffic. The value in U2MR specifies how many packets are allowed to flood within the time specified by bit [6:4]. To disable this function, program U2MR to 0.
(Default = 4'h8)
- Bit [6:4]:
- TimeBase: **(Default = 000)**
 - 000 = 10us
 - 001 = 20us
 - 010 = 40us
 - 011 = 80us
 - 100 = 160us
 - 101 = 320us
 - 110 = 640us
 - 111 = 10us, same as 000.
- Bit [7]:
- Select VLAN tag or TOS field (IP packets) to be preferentially picked to map transmit priority and drop priority **(Default = 0)**.
 - 0 - Select VLAN tag priority field over TOS field
 - 1 - Select TOS field over VLAN tag priority field

10.7.4 AVPML - VLAN Priority MapI²C Address h041; Serial Interface Address:h503Accessed by serial interface and I²C (R/W)

Registers AVPML, AVPMM, and AVPMH allow the eight VLAN priorities to map into eight internal level transmit priorities. Under the internal transmit priority, “seven” is the highest priority where as “zero” is the lowest. This feature allows the user the flexibility of redefining the VLAN priority field. For example, programming a value of 7 into bit 2:0 of the AVPML register would map packet VLAN priority) into internal transmit priority 7. The new priority is used only inside the 2801. When the packet goes out it carries the original priority.

- Bit [2:0]:
- Mapped priority of 0 **(Default 000)**
- Bit [5:3]:
- Mapped priority of 1 **(Default 001)**
- Bit [7:6]:
- Mapped priority of 2 **(Default 10)**

10.7.5 AVPMM - VLAN Priority Map

I²C Address h042, Serial Interface Address:h504

Accessed by serial interface and I²C (R/W)

Map VLAN priority into eight level transmit priorities:

- Bit [0]: • Mapped priority of 2 (**Default 0**)
- Bit [3:1]: • Mapped priority of 3 (**Default 011**)
- Bit [6:4]: • Mapped priority of 4 (**Default 100**)
- Bit [7]: • Mapped priority of 5 (**Default 1**)

10.7.6 AVPMH - VLAN Priority Map

I²C Address h043, Serial Interface Address:h505

Accessed by serial interface and I²C (R/W)

Map VLAN priority into eight level transmit priorities:

- Bit [1:0]: • Mapped priority of 5 (**Default 10**)
- Bit [4:2]: • Mapped priority of 6 (**Default 110**)
- Bit [7:5]: • Mapped priority of 7 (**Default 111**)

10.7.7 TOSPML - TOS Priority Map

I²C Address h044, Serial Interface Address:h506

Accessed by serial interface and I²C (R/W)

Map TOS field in IP packet into four level transmit priorities

- Bit [2:0]: • Mapped priority when TOS is 0 (**Default 000**)
- Bit [5:3]: • Mapped priority when TOS is 1 (**Default 001**)
- Bit [7:6]: • Mapped priority when TOS is 2 (**Default 10**)

10.7.8 TOSPM - TOS Priority MapI²C Address h045, Serial Interface Address:h507Accessed by serial interface and I²C (R/W)

Map TOS field in IP packet into four level transmit priorities

- Bit [0]: • Mapped priority when TOS is 2 (**Default 0**)
- Bit [3:1]: • Mapped priority when TOS is 3 (**Default 011**)
- Bit [6:4]: • Mapped priority when TOS is 4 (**Default 100**)
- Bit [7]: • Mapped priority when TOS is 5 (**Default 1**)

10.7.9 TOSPMH - TOS Priority MapI²C Address h046, Serial Interface Address:h508Accessed by serial interface and I²C (R/W)

Map TOS field in IP packet into four level transmit priorities:

- Bit [1:0]: • Mapped priority when TOS is 5 (Default 01)
- Bit [4:2]: • Mapped priority when TOS is 6 (Default 110)
- Bit [7:5]: • Mapped priority when TOS is 7 (Default 111)

10.7.10 AVDM - VLAN Discard MapI²C Address h047, Serial Interface Address:h509Accessed by serial interface and I²C (R/W)

Map VLAN priority into frame discard when low priority buffer usage is above threshold. Frames with high discard (drop) priority will be discarded (dropped) before frames with low drop priority.

- 0 - Low discard priority
- 1 - High discard priority

- Bit [0]:
- Frame discard priority for frames with VLAN transmit priority 0 **(Default 0)**
- Bit [1]:
- Frame discard priority for frames with VLAN transmit priority 1 **(Default 0)**
- Bit [2]:
- Frame discard priority for frames with VLAN transmit priority 2 **(Default 0)**
- Bit [3]:
- Frame discard priority for frames with VLAN transmit priority 3 **(Default 0)**
- Bit [4]:
- Frame discard priority for frames with VLAN transmit priority 4 **(Default 0)**
- Bit [5]:
- Frame discard priority for frames with VLAN transmit priority 5 **(Default 0)**
- Bit [6]:
- Frame discard priority for frames with VLAN transmit priority 6 **(Default 0)**
- Bit [7]:
- Frame discard priority for frames with VLAN transmit priority 7 **(Default 0)**

10.7.11 **TOSDML - TOS Discard Map**

I²C Address h048, Serial Interface Address:h50A

Accessed by serial interface and I²C (R/W)

Map TOS into frame discard when low priority buffer usage is above threshold

- Bit [0]:
- Frame discard priority for frames with TOS transmit priority 0 **(Default 0)**
- Bit [1]:
- Frame discard priority for frames with TOS transmit priority 1 **(Default 0)**
- Bit [2]:
- Frame discard priority for frames with TOS transmit priority 2 **(Default 0)**
- Bit [3]:
- Frame discard priority for frames with TOS transmit priority 3 **(Default 0)**
- Bit [4]:
- Frame discard priority for frames with TOS transmit priority 4 **(Default 0)**
- Bit [5]:
- Frame discard priority for frames with TOS transmit priority 5 **(Default 0)**
- Bit [6]:
- Frame discard priority for frames with TOS transmit priority 6 **(Default 0)**
- Bit [7]:
- Frame discard priority for frames with TOS transmit priority 7 **(Default 0)**

10.7.12 **BMRC - Broadcast/Multicast Rate Control**

I²C Address h049, Serial Interface Address:h50B

Accessed by serial interface and I²C (R/W)

This broadcast and multicast rate defines for each port the number of incoming packet allowed to be forwarded within a specified time. Once the packet rate is reached, packets will be dropped. To turn off the rate limit, program the field to 0.

- Bit [3:0]: • Multicast Rate Control Number of multicast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). **(Default 0)**.
- Bit [7:4]: • Broadcast Rate Control Number of broadcast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). **(Default 0)**

10.7.13 UCC - Unicast Congestion Control

I²C Address h04A, Serial Interface Address:h50C

Accessed by serial interface and I²C (R/W)

- Bit [7:0]: • Number of frame count. Used for best effort dropping at B% when destination port's best effort queue reaches UCC threshold and shared pool is all in use. Granularity 16 frame. **(Default: h07)**

10.7.14 MCC - Multicast Congestion Control

I²C Address h0B7, Serial Interface Address:h50D

Accessed by serial interface and I²C (R/W)

- Bit [3:0]: • In multiples of two. Used for triggering MC flow control when destination port's best effort queue reaches MCC threshold. **(Default 5'h08)**
- Bit [4]: • Must be 0
- Bit [7:5]: • Flow control reaction period. ([7:5] 4)+3 usec **(Default 3'h2)**.

10.7.15 PRG - Port Reservation for Giga portsI²C Address h0B9, Serial Interface Address:h50FAccessed by serial interface and I²C (R/W)

7	0
Buffer low thd	Per source buffer Reservation

- Bit [3:0]:
- Per source buffer reservation. Define the space in the FDB reserved for each port. Expressed in multiples of 16 packets. For each packet 1536 bytes are reserved in the memory.
Default: 4'hA for 4MB memory
4'h6 for 2MB memory
4'h3 for 1MB memory
- Bits [7:4]:
- Expressed in multiples of 16 packets. Threshold for dropping all best effort frames when destination port best effort queues reach UCC threshold and shared pool is all used and source port reservation is at or below the PRG[7:4] level. Also the threshold for initiating UC flow control.
Default: 4'h6 for 4MB memory
4'h2 for 2MB memory
4'h1 for 1MB memory

FCB Reservation**10.7.16 SFCB - Share FCB Size**I²C Address h04E), Serial Interface Address:h510Accessed by serial interface and I²C (R/W)

7	0
Shared buffer size	

- Bits [7:0]:
- Expressed in multiples of 8. Buffer reservation for shared pool.
 - (Default 4G & 4M = 8'd62)
 - (Default 4G & 2M = 8'd20)
 - (Default 4G & 1M = 8'd08)
 - (Default 8G & 4M = 8'd150)
 - (Default 8G & 2M = 8'd55)
 - (Default 8G & 1M = 8'd25)

10.7.17 C2RS - Class 2 Reserved Size

I²C Address h04F, Serial Interface Address:h511

Accessed by serial interface and I²C (R/W)

Bits [7:0]:

- Buffer reservation for class 2 (third lowest priority). Granularity 2. **(Default 8'h00)**

10.7.18 C3RS - Class 3 Reserved Size

I²C Address h050, Serial Interface Address:h512

Accessed by serial interface and I²C (R/W)

Bits [7:0]:

- Buffer reservation for class 3. Granularity 2. **(Default 8'h00)**

10.7.19 C4RS - Class 4 Reserved Size

I²C Address h051, Serial Interface Address:h513

Accessed by serial interface and I²C (R/W)

Bits [7:0]:

- Buffer reservation for class 4. Granularity 2. **(Default 8'h00)**

10.7.20 C5RS - Class 5 Reserved Size

I²C Address h052; Serial Interface Address:h514

Accessed by serial interface and I²C (R/W)

Bits [7:0]:

- Buffer reservation for class 5. Granularity 2. **(Default 8'h00)**

10.7.21 C6RS - Class 6 Reserved Size

I²C Address h053; Serial Interface Address:h515

Accessed by serial interface and I²C (R/W)

- Bits [7:0]:
- Buffer reservation for class 6 (second highest priority). Granularity 2. **(Default 8'h00)**

10.7.22 C7RS - Class 7 Reserved Size

I²C Address h054; Serial Interface Address:h516

Accessed by serial interface and I²C (R/W)

- Bits [7:0]:
- Buffer reservation for class 7 (highest priority). Granularity 2. **(Default 8'h00)**

Classes Byte Gigabit Port 0**10.7.23 QOSC00 - BYTE_C2_G0**

I²C Address h055, Serial Interface Address:h517

- Bits [7:0]:
- Byte count threshold for C2 queue WRED **(Default 8'h28)**
(1024byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

10.7.24 QOSC01 - BYTE_C3_G0

I²C Address h056, Serial Interface Address:h518

- Bits [7:0]:
- Byte count threshold for C3 queue WRED **(Default 8'h28)**
(512byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

10.7.25 QOSC02 - BYTE_C4_G0

I²C Address h057, Serial Interface Address:h519

- Bits [7:0]:
- Byte count threshold for C4 queue WRED (**Default 8'h28**)
(256byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

10.7.26 QOSC03 - BYTE_C5_G0

I²C Address h058, Serial Interface Address:h51A

- Bits [7:0]:
- Byte count threshold for C5 queue WRED (**Default 8'h28**)
(128byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

10.7.27 QOSC04 - BYTE_C6_G0

I²C Address h059, Serial Interface Address:h51B

- Bits [7:0]:
- Byte count threshold for C6 queue WRED (**Default 8'h50**)
(64byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

10.7.28 QOSC05 - BYTE_C7_G0

I²C Address h05A, Serial Interface Address:h51C

- Bits [7:0]:
- Byte count threshold for C6 queue WRED (**Default 8'h50**)
(64byte/unit when Delay Bound is used)
(1024byte/unit when WFQ is used)

QOSC00 through QOSC05 represent the values F-A in Table 3 for Gigabit port 0. They are per-queue byte thresholds for weighted random early drop (WRED). QOSC05 represents A, and QOSC00 represents F.

Classes Byte Gigabit Port 1**10.7.29 QOSC06 - BYTE_C2_G1**

- Bits [7:0]:
- Byte count threshold for C6 queue WRED (**Default 8'h50**)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.34 QOSC0B - BYTE_C7_G1

I²C Address h060, Serial Interface Address:h522

- Bits [7:0]:
- Byte count threshold for C7 queue WRED (**Default 8'h50**)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

QOSC06 through QOSC0B represent the values F-A in Table 3. They are per-queue byte thresholds for random early drop. QOSC0B represents A, and QOSC06 represents F.

Classes Byte Gigabit Port 2**10.7.35 QOSC0C - BYTE_C2_G2**

I²C Address h061, Serial Interface Address:h523

- Bits [7:0]:
- Byte count threshold for C2 queue WRED (**Default 8'h28**)
(1024 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.36 QOSC0D - BYTE_C3_G2

I²C Address h062, Serial Interface Address:h524

- Bits [7:0]:
- Byte count threshold for C3 queue WRED (**Default 8'h28**)
(512 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.37 QOSC0E - BYTE_C4_G2

I²C Address h063, Serial Interface Address:h525

- Bits [7:0]:
- Byte count threshold for C4 queue WRED (**Default 8'h28**)
(256 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.38 QOSC0F - BYTE_C5_G2

I²C Address h064, Serial Interface Address:h526

- Bits [7:0]:
- Byte count threshold for C5 queue WRED (**Default 8'h28**)
(128 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.39 QOSC10 - BYTE_C6_G2

I²C Address h065, Serial Interface Address:h527

- Bits [7:0]:
- Byte count threshold for C6 queue WRED (Default 8'h50)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.40 QOSC11 - BYTE_C7_G2

I²C Address h066, Serial Interface Address:h528

- Bits [7:0]:
- Byte count threshold for C7 queue WRED (Default 8'h50)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

QOSC0C through QOSC11 represent the values F-A in Table 3 for Gigabit port 2. They are per-queue byte thresholds for random early drop. QOSC11 represents A, and QOSC0C represents F.

Classes Byte Gigabit Port 3**10.7.41 QOSC12 - BYTE_C2_G3**

I²C Address h067, Serial Interface Address:h529

- Bits [7:0]:
- Byte count threshold for C2 queue WRED (**Default 8'h28**)
(1024 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.42 QOSC13 - BYTE_C3_G3

I²C Address h068, Serial Interface Address:h52A

- Bits [7:0]:
- Byte count threshold for C3 queue WRED (**Default 8'h28**)
(512 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.43 QOSC14 - BYTE_C4_G3

I²C Address h069, Serial Interface Address:h52B

- Bits [7:0]:
- Byte count threshold for C4 queue WRED (**Default 8'h28**)
(256 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.44 QOSC15 - BYTE_C5_G3

I²C Address h06A, Serial Interface Address:h52C

- Bits [7:0]:
- Byte count threshold for C5 queue WRED (**Default 8'h28**)
(128 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.45 QOSC16 - BYTE_C6_G3

I²C Address h06B, Serial Interface Address:h52D

- Bits [7:0]:
- Byte count threshold for C6 queue WRED (**Default 8'h50**)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

10.7.46 QOSC17 - BYTE_C7_G3

I²C Address h06C, Serial Interface Address:h52E

- Bits [7:0]:
- Byte count threshold for C7 queue WRED (**Default 8'h50**)
(64 byte/unit when Delay Bound is used)
(1024 byte/unit when WFQ is used)

QOSC12 through QOSC17 represent the values F-A in Table 3 for Gigabit port 3. They are per-queue byte thresholds for random early drop. QOSC17 represents A, and QOSC12 represents F.

Classes Byte Gigabit Port 4 (Useless in MVTX2801)**10.7.47 QOSC18 - BYTE_C2_G4**

QOSC6B through QOSC72 are useless in MVTX2801

Class 6 Shaper Control Port G0**10.7.138 QOSC73 - TOKEN_RATE_G0**

Serial Interface Address:h58A

Bits [7:0] • Bytes allow to transmit every frame time (0.512usec) when regulated by Shaper logic. (Default: 8'h08)

10.7.139 QOSC74 - TOKEN_LIMIT_G0

Serial Interface Address:h58B

Bits [7:0] • Bytes allow to continue transmit out when regulated by Shaper logic. (16byte/unit) (Default: 8'hC0)

QOSC73 and QOSC74 correspond to parameters from section 7.6 on the shaper for EF traffic. QOSC73 is an integer less than 64, with granularity 1. QOSC74 is the programmed maximum value of the counter (maximum burst size). This value is expressed in multiples of 16. QOSC73 and QOSC74 apply to Gigabit port 0. Register QOSC39-CREDIT_C6_G0 programs the peak rate. See QoS application note for more information.

Class 6 Shaper Control Port G1**10.7.140 QOSC75 - TOKEN_RATE_G1**

Serial Interface Address:h58C

Bits [7:0] • Bytes allow to transmit every frame time (0.512usec) when regulated by Shaper logic. (Default: 8'h08)

10.7.141 QOSC76 - TOKEN_LIMIT_G1

Serial Interface Address:h58D

Bits [7:0] • Bytes allow to continue transmit out when regulated by Shaper logic. (16byte/unit) (Default: 8'hC0)

QOSC75 and QOSC76 correspond to parameters from section 7.6 on the shaper for EF traffic. QOSC75 is an integer less than 64, with granularity 1. QOSC76 is the programmed maximum value of the counter (maximum burst size). This value is expressed in multiples of 16. QOSC75 and QOSC76 apply to Gigabit port 1. Register QOSC41-CREDIT_C6_G1 programs the peak rate. See QoS application note for more information.

Class 6 Shaper Control Port G2**10.7.142 QOSC77 - TOKEN_RATE_G2**

Serial Interface Address:h58E

- Bits [7:0] • Bytes allow to transmit every frame time (0.512usec) when regulated by Shaper logic. (Default: 8'h08)

10.7.143 QOSC78 - TOKEN_LIMIT_G2

Serial Interface Address:h58F

- Bits [7:0] • Bytes allow to continue transmit out when regulated by Shaper logic. (16byte/unit) (Default: 8'hC0)

QOSC77 and QOSC78 correspond to parameters from section 7.6 on the shaper for EF traffic. QOSC77 is an integer less than 64, with granularity 1. QOSC78 is the programmed maximum value of the counter (maximum burst size). This value is expressed in multiples of 16. QOSC77 and QOSC78 apply to Gigabit port 2. Register QOSC49-CREDIT_C6_G2 programs the peak rate. See QoS application note for more information.

Class 6 Shaper Control Port G3**10.7.144 QOSC79 - TOKEN_RATE_G3**

Serial Interface Address:h590

- Bits [7:0] • Bytes allow to transmit every frame time (0.512usec) when regulated by Shaper logic. (Default: 8'h08)

10.7.145 QOSC7A - TOKEN_LIMIT_G3

Serial Interface Address:h591

- Bits [7:0] • Bytes allow to continue transmit out when regulated by Shaper logic. (16byte/unit) (Default: 8'hC0)

QOSC79 and QOSC7A correspond to parameters from section 7.6 on the shaper for EF traffic. QOSC79 is an integer less than 64, with granularity 1. QOSC7A is the programmed maximum value of the counter (maximum burst size). This value is expressed in multiples of 16. QOSC79 and QOSC7A apply to Gigabit port 3. Register QOSC51-CREDIT_C6_G3 programs the peak rate. See QoS application note for more information.

10.8.12 CHECKSUM - EEPROM Checksum

I²C Address h0C5, Serial Interface Address:h60B

Accessed by serial interface and I²C (R/W)

- Bit [7:0]:
- (Default 00)
 - Before requesting that the MVTX2801AG updates the EEPROM device, the correct checksum needs to be calculated and written into this checksum register. The checksum formula is:

$$FF - \sum_{i=0}^{i=0} i^2C \text{ register} = 0$$

After booting cycle the MVTX2801AG calculates the checksum. If the checksum is not zeroed the MVTX2801AG does not start.

10.8.13 LED User

10.8.14 LEDUSER0

I²C Address h0BB, Serial Interface Address:h60C

1: invert polarity

Bit [7:4] (Default 4'H3)
Signal Select
0: not select
1: select the corresponding bit

When bits get selected, the led_byteout_[4] = AND (all selected bits)

10.8.19 LEDUSER5/LEDSIG5I²C Address:h0C0, Serial Interface Address:h611

Access by CPU, serial interface (R/W)

Bit [7:0] (Default 8'H20)
Content will be sent out by LED serial shift logic.

In parallel mode: this register is used for programming the LED pin - led_byteout_[5]

Bit [3:0] (Default 4'H0)
Signal polarity:
0: not invert polarity (high true)
1: invert polarity

Bit [7:4] (Default 4'H2)
Signal Select:
0: not select
1: select the corresponding bit

When bits get selected, the led_byteout_[5] = AND (all selected bits)

10.8.20 LEDUSER6/LEDSIG6I²C Address:h0C1, Serial Interface Address:h612

Access by CPU, serial interface (R/W)

Bit [7:0] (Default 8'H40)
Content will be sent out by LED serial shift logic.

In parallel mode: this register is used for programming the LED pin - led_byteout_[6]

Bit [3:0] (Default 4'B0000)
Signal polarity:
0: not invert polarity (high true)
1: invert polarity

Bit [7:4] (Default 4'b0100)
Signal Select:
0: not select
1: select the corresponding bit

When bits get selected, the led_byteout_[6] = AND (all selected bits), or the polarity of led_byteout_[6] is controlled by LEDSIG1_0[3]

10.8.21 LEDUSER7/LEDSIG1_0

I²C Address:h0C2, Serial Interface Address:h613

Access by CPU, serial interface (R/W)

Bit [7:0] (Default 8'H61)
Content will be sent out by LED serial shift logic.

In parallel mode: this register is used for programming the LED pin - led_byteout_[2]

7				4	3		0
GP	RX	TX	FC	P6	RX	TX	FC

Bit [7] (Default 1'B0)
Global output polarity: this bit controls the output polarity of all led_byteout_ and led_port_sel pins.
0: no invert polarity - (led_byteout_[7:0] are high activated, led_port_sel[9:0] are low activated)
1: invert polarity - (led_byteout_[7:0] are low activated, led_port_sel[9:0] are high activated)

Bit [6:4] (Default 3'B110)
Signal Select
0: not select
1: select the corresponding bit

When bits get selected, the led_byteout_[6] = OR (all selected bits)

Bit[3] (Default 1'B0)
Polarity control of led_byteout_[6]
0: not invert
1: invert

Bit [2:0] (Default 3'b001)
Signal Select:
0: not select
1: select the corresponding bit

When bits get selected, the led_byteout_[0] = OR (all selected bits)

10.9.8 DTST - Data Read Back Register

Serial Interface Address: hF07

Accessed by CPU and serial interface (RO)

This register provides various internal information as selected in DPST bit[2:0]

- Bit[0]:
- Flow control enabled
- Bit[1]:
- Full duplex port
- Bit[2]:
- Fast ethernet port (if not giga)
- Bit[3]:
- Link is down
- Bit[4]:
- GIGA port
- Bit[5]:
- Signal detect (when PCS interface mode)
- Bit[6]:
- Pipe signal detected (pipe mode only)
- Bit[7]:
- Module detected (for hot swap purpose)

11.3 Ball- Signal Descriptions

All pins are CMOS type; all Input pins are 5 Volt tolerance, and all Output pins are 3.3 CMOS drive.

Ball No(s)	Symbol	I/O	Description
K27, L27, K30, K29, K28	P_DATA[15:11]	I/O-TS with pull up	Not used - leave unconnected
L30	P_DATA[10]	I/O - TS with pull up	Trunk enable External pull up or unconnected- disable trunk group 0 and 1 External pull down - enable trunk group 0 and 1 See register TRUNK0_MODE for port selection and trunk enable.
N27	P_DATA[9]	I/O - TS with pull up	Trunk enable External pull up or unconnected - disable trunk group 2 and 3 External pull down - enable trunk group 2 and 3 See register TRUNK1_MODE for port selection and trunk enable.
L29, L28, N26, M30, M29, M28, N30, N29, N28	P_DATA[8:0]	I/O - TS with pull up	Bootstrap function - See bootstrap section
J28	P_A[2]	Input	Not used - leave unconnected
H28	P_INT#	Output	Not used - leave unconnected
I²C Interface (0) Note: In unmanaged mode, Use I²C and Serial control interface to configure the system			
J27	SCL	Output	I ² C Data Clock
M26	SDA	I/O-TS with pull up	I ² C Data I/O
Serial Control Interface			
J29	PS_STROBE	Input with weak internal pull up	Serial Strobe Pin
L26	PS_DO	Input with weak internal pull up	Serial Data Input
J30	PS_DI (AUTOFD)	Output with pull up	Serial Data Output (AutoFD)
Frame Buffer Interface			
U1, U2, N4, U3, U4, T1, T2, N5, T3, T4, M4, R4, R3, R2, R1, M5, R5, L4, P3, P2, P1, N3, L5, N2, P5, N1, K4, M3, M2, M1, K5, L3, J5, K2, H4, K1, J4, J3, J2, H5, J1, H3, H2, H1, G3, G4, G5, G2, G1, F5, F4, F3, F2, F1, D3, E1, E2, E3, D2., E4, C3, D1, C1, B2	LA_D[63:0]	I/O-TS with pull up	Frame Bank A- Data Bit [63:0]
AA1, V5, AA2, AA3, Y1, V4, Y2, Y3, U5, W1, W2, W3, T5, V1, V2, P4, V3	LA_A[19:3]	Output	Frame Bank A - Address Bit [19:3]
W4	LA_A[20]	Output with pull up	Frame Bank A - Address Bit [20]
C2	LA_CLK	Output	Frame Bank A Clock Input
K3	LA_CS0#	Output with pull up	Frame Bank A Low Portion Chip Selection
L1	LA_CS1#	Output with pull up	Frame Bank A High Portion Chip Selection
L2	LA_RW#	Output with pull up	Frame Bank A Read/Write

Table 7 - Ball- Signal Descriptions

Ball No(s)	Symbol	I/O	Description
D18, B18, C18, A17, E17, B17, C17, E16, D17, B16, E15, C16, D16, D15, E14, C15, B15, E13, A15, D14, C14, D13, B14, A14, C13, E12, B13, A13, D12, C12, B12, A12, A11, E10, C10, B10, E9, A10, D11, D10, D8, D9, C9, B9, A9, C8, B8, A8, C7, E7, D7, B7, E8, A7, D6, C6, E6, B6, A6, A5, B5, C5, B4, A4	NC	I/O-TS with pull up.	No Connect
D22, D20, E20, D21, A21, D19, B21, C21, A20, B20, E19, C20, A19, B19, E18, C19, A18	NC	Output	
F	LB_A[20]	Output with pull up	Bootstrap Pin
D5	NC	Output	
B11	NC	Output with pull up	
E11	NC	Output with pull up	
C11	NC	Output with pull up	
Switch Database Interface			
E24, B27, D27, C27, A27, A28, B30, D28, E27, C30, D30, G26, E28, D29, E26, E29, H26, E30, J26, F30, F29, F28, F27, H27, G30, G29, K26, G27, G28, H30, H29, M27	B_D[31:0]	I/O-TS with pull up	Switch Database Domain - Data Bit [31:0]
C22, B22, A22, E22, C23, B23, A23, C24, D24, D23, B24, A24, E23, C25, C26, B25, A25	B_A[18:2]	Output	Switch Database Address (512K) - Address Bit [18:2]
C29	B_CLK	Output	Switch Database Clock Input
D25	B_ADSC#	Output with pull up	Switch Database Address Status Control
B26	B_WE#	Output with pull up	Switch Database Write Chip Select
A26	B_OE#	Output with pull up	Switch Database Read Chip Select
MII Management Interface			
AJ16	M_MDC	Output	MII Management Data Clock - (common for all MII Ports [3:0])
AG18	M_MDIO	I/O-TS with pull up	MII Management Data I/O - (common for all MII Ports [3:0]) 2.5Mhz
GMII / MII Interface (193) Gigabit Ethernet Access Port			
AJ11, AJ6, AF3, AA4	REF_CLK [3:0]	Input w/ pull up	Gigabit Reference Clock
AD29, AK30, AJ22, AG17	NC		
AK15	CM_CLK	Input w/ pull up	Common Clock shared by port G[3:0]
AF17	IND/CM	Input w/ pull up	1: select REF_CLK[3:0] as clock 0: select CM_CLK as clock for all ports
AJ13, AH7, AH3, AB1	MII TX CLK[3:0]	Input w/ pull up	
AA30, AK29, AG25, AK18,	NC		

Table 7 - Ball- Signal Descriptions (continued)

Ball No(s)	Symbol	I/O	Description
AG16, AF16, AG15, AF18, AF15, AH15, AJ15, AG14	G3_RXD[7:0]	Input w/ pull up	G[3:0] port - Receive Data Bit [7:0]
AG11, AJ10, AF11, AF10, AG9, AF9, AH9, AJ9	G2_RXD[7:0]		
AF6, AJ5, AF5, AG6, AK4, AF4, AK3, AH4	G1_RXD[7:0]

AK24, AJ24, AG24, AF24, AH24, AF23, AK23, AJ23			
AJ19, AH19, AJ18, AH18, AF20, AK17, AG19, AJ17			
AG13, AH8, AK2, AD2	G[3:0]_TXD[8]	Output w/ pull up	G[3:0]port - PMA Transmit Data Bit [8]
Y27, AG29, AH25, AK19,	NC		

Table 7 - Ball- Signal Descriptions (continued)

Ball No(s)	Symbol	I/O	Description
AJ14, AK9, AJ3, AB5	G[3:0]_TX_D[9]	Output w/ pull up	G[3:0]port - PMA Transmit Data Bit [9]
AB27, AF30, AF25, AH20,	NC		
AH11, AG5, AG2, AB4	G[3:0]_TXCLK	Output	G[3:0]port - PMA Gigabit Transmit Clock
AD28, AH30, AK22, AH17,	NC		
Test Facility (3)			
U29	T_MODE0	I/O-TS with pull up	Test - Set upon Reset, and provides NAND Tree test output during test mode Use external Pull up for normal operation
U28	T_MODE1	I/O-TS with pull up	Test - Set upon Reset, and provides NAND Tree test output during test mode. Use external Pull up for normal operation
A3	SCAN_EN	Input with pull down	Enable test mode For normal operation leave it unconnected
LED Interface (serial and parallel)			
R28, T26, R27, T27, U27, T28, T29, T30	T_D[7:0]/ LE_PD[7:0]	Output	While resetting, T_D[7:0] are in input mode and are used as strapping pins. Internal pull up LE_PD - Parallel Led data [7:0]
P27, R26, R30, R29	T_D[11:8]/ LE_PT[3:0]	Output	While resetting, T_D[11:8] are in input mode and are used as strapping pins. Internal pull up LED_PR[3:0] - Parallel Led port selection [3:0]
P26, P30, P29, P28,	T_D[15:12]/ LE_PT[7:4]	Output	While resetting, T_D[15:12] are in input mode and are used as strapping pins. Internal pull up LED_PR[7:4] - No Meaning
V29	LE_CLK0/ LE_PT[8]	Output	LE_CLK0 - LED Serial Interface Output Clock LE_PT[8] - Parallel Led port sel [8]
V30	LED_BLINK/ LE_DO/ LE_PT[9]	Output	While resetting, LED-BLINK is in input mode and is used as strapping pin. 1: No Blink, 0: Blink. Internal pull up. LE_DO - LED Serial Data Output Stream LE_PT[9] - Parallel Led port sel [9]
V28	LED_PM/ LE_SYNC0#	Output with pull up	While resetting, LED_PM is in input mode and is used as strapping pin. Internal pull up. 1: Enable parallel interface, 0: enable serial interface. LE_SYNC0# - LED Output Data Stream Envelop
System Clock, Power, and Ground Pins			
A16	S_CLK	Input	System Clock at 133 MHz
U26	S_RST#	Input - ST	Reset Input
U30	RESOUT#	Output	Reset PHY

Table 7 - Ball- Signal Descriptions (continued)

Ball No(s)	Symbol	I/O	Description
After reset T_d[15:0] are used by the LED interface			
T30	T_d[0]	1	Giga link active status 0 - active low 1 - active high
T29	T_d[1]	1	Power saving 0 - No power saving 1 - Power saving Stop MAC clock if no MAC activity.
T28	T_d[2]	1	- Must be 0 (Use external pull down)
U27	T_d[3]	1	Hot plug port module detection enable 0 - module detection enable 1 - module detection disable
T27	T_d[4]	1	- Must be 0 (Use external pull down)
R27	T_d[5]	1	SRAM memory size 0 - 512K SRAM 1 - 256K SRAM
T26	T_d[6]	1	CPU Port mode 0 - 8 bit cpu data bus 1 - 16 bit cpu data bus
R28	T_d[7]	1	FDB memory depth 1 - one memory layer 0 - two memory layers
W4, E21	La_a[20], Lb_a[20]	11	FDB memory size 11 - 2M per bank = 4M total 10 - 1M per bank = 2M total 0x - 512K per bank = 1M total
R29	T_d[8]	1	EEPROM installed 0 - EEPROM is installed 1 - EEPROM is not installed
R30	T_d[9]	1	MCT Aging enable 0 - MCT aging disable 1 - MCT aging enable
R26	T_d[10]	1	FCB handle aging enable 0 - FCB handle aging disable 1 - FCB handle aging enable
P27	T_d[11]	1	Timeout reset enable 0 - timeout reset disable 1 - timeout reset enable Issue reset if any state machine did not go back to idle for 5sec.
P28	T_d[12]	1	Speed-up test 0 - enable test speed up. DO NOT USE. 1 - disable test speed up
P29	T_d[13]	1	Enable debounce for strobe signal 0 - disable debounce on strobe signal using 1msec clock - DO NOT USE. 1 - enable debounce on strobe signal
P30	T_d[14]	1	CPU installed 0 - CPU installed. 1 - CPU is not installed.
P26	T_d[15]	1	External RAM test 0 - Perform the infinite loop of ZBT RAM BIST. Debug test only 1 - Regular operation.

Table 7 - Ball- Signal Descriptions (continued)

Ball No(s)	Symbol	I/O	Description
N30, N29, N28	P_d[2:0]	111	ZBT RAM la_clk turning 3'b000 - control by reg. LCLKCR[2:0] 3'b001 - delay by method # 0 3'b010 - delay by method # 1 3'b011 - delay by method # 2 3'b100 - delay by method # 3 3'b101 - delay by method # 4 3'b110 - delay by method # 5 3'b111 - delay by method # 6 - USE THIS METHOD
M30, M29, M28	P_d[5:3]	111	No Use
L29, L28, N26	P_d[8:6]	111	SBRAM b_clk turning 3'b000 - control by BCLKCR[2:0] 3'b001 - delay by method # 0 3'b010 - delay by method # 1 3'b011 - delay by method # 2 3'b100 - delay by method # 3 3'b101 - delay by method # 4 3'b110 - delay by method # 5 3'b111 - delay by method # 6 - USE THIS METHOD

Table 7 - Ball- Signal Descriptions (continued)

Notes:

= Active low signal

Input = Input signal

In-ST = Input signal with Schmitt-Trigger

Output = Output signal (Tri-State driver)

Out-OD= Output signal with Open-Drain driver

I/O-TS = Input & Output signal with Tri-State driver

I/O-OD = Input & Output signal with Open-Drain driver

Table 8 - Ball Signal Name (continued)

11.5 AC/DC Timing**11.5.1 Absolute Maximum Ratings**

Storage Temperature	-65°C to +150°C
Operating Temperature	-40°C to +85°C
Supply Voltage VDD33 with Respect to VSS	+3.0 V to +3.6 V
Supply Voltage VDD with Respect to VSS	+2.38 V to +2.75 V
Voltage on Input Pins	-0.5 V to (VDD33 + 3.3 V)

Caution: Stress above those listed may damage the device. Exposure to the Absolute Maximum Ratings for extended periods may affect device reliability. Functionality at or above these limits is not implied.

11.5.2 DC Electrical Characteristics

VDD33 = 3.0 V to 3.6 V (3.3V +/- 10%)

T_{AMBIENT} = -40°C to +85°C

VDD = 2.5V +10% - 5%

11.5.3 Recommended Operation Conditions

Symbol	Parameter Description	Preliminary			Unit
		Min	Type	Max	
fosc	Frequency of Operation		133		MHz
I _{DD1}	Supply Current - @ 133 MHz (VDD33 = 3.3V)	680		850	mA
I _{DD2}	Supply Current - @ 133 MHz (VDD = 2.5V)	1300		1500	mA
V _{OH}	Output High Voltage (CMOS)	VDD33 - 0.5			V
V _{OL}	Output Low Voltage (CMOS)			0.5	V
V _{IH-TTL}	Input High Voltage (TTL 5V tolerant)	VDD33 x 70%		VDD33 + 2.0	V
V _{IL-TTL}	Input Low Voltage (TTL 5V tolerant)			VDD33 x 30%	V
I _{IH-5VT}	Input Leakage Current (0.1 V < V _{IN} < VDD33)			10	μA
I _{IL-5VT}	Output Leakage Current (0.1 V < V _{OUT} < VDD33)				μA
C _{IN}	Input Capacitance			5	pF
C _{OUT}	Output Capacitance			5	pF
C _{I/O}	I/O Capacitance			7	pF
