DM9024/DM8024 Dual J-K Flip-Flops with Preset and Clear

General Description

The DM9024 series device is designed to be used in existing systems as replacements for Fairchild 9000-type circuits. These DM9024 circuits offer several significant advantages over 9024 type circuits, some of which are:

- Input clamp diodes
- Output short-circuit current specified to guarantee the high-level impedance.

The DM9024 circuit is characterized for operation over the industrial temperature range of 0°C to 75°C.

For the new designs, the 54/74 families of TTL circuits offer the industry's broadest choice of high-performance digital circuits. Series 54/74 pin-for-pin equivalents are available for the following SSI types:

H	H	↑	L	H	Q ₀	$\bar{Q}_0$
H	H	↑	H	H	H	L
H	H	L	X	X	Q ₀	$\bar{Q}_0$

H = High Level (Steady State), L = Low Level (Steady State).

X = Don't Care

↑ = Transition from low to high level

Q₀ = The level of Q before the indicated input conditions were established.

TOGGLE: Each output changes to the complement of its previous level on each active transition of the clock.

*This configuration is nonstable. That is, it will not persist when preset and clear inputs return to their inactive (high) level.

Absolute Maximum Ratings (Note)

Specifications for Military/Aerospace products are not contained in this datasheet. Refer to the associated reliability electrical test specifications document.

Supply Voltage	7V
Input Voltage	5.5V
Operating Free Air Temperature Range	
DM90	−55°C to +125°C
DM80	0°C to +70°C
Storage Temperature Range	−65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
