

144 pin SO-DIMM SDRAM Modules

HYS64V8200GDL
HYS64V16220GDL

64MB & 128 MB PC100 / PC133

- 144 Pin Eight Byte Small Outline Dual-In-Line Synchronous DRAM Modules for PC 100 and PC133 notebook applications
- one bank 8M x 64 and two bank 16M x 64 non-parity module organisation
- Performance:

		-7	-7.5	-8	
		PC133 2-2-2	PC133 3-3-3	PC100 2-2-2	Units
f _{CK}	Clock frequency (max.)	133	133	100	MHz
t _{AC}	Clock access time	5.4	5.4	6	ns

- Single +3.3V(± 0.3V) power supply
- Programmable $\overline{\text{CAS}}$ Latency, Burst Length and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- Decoupling capacitors mounted on substrate
- All inputs, outputs are LVTTTL compatible
- Serial Presence Detect with E²PROM
- Uses 8M x 16 128Mbit SDRAM components
- 4096 refresh cycles every 64 ms
- Gold contact pad, JEDEC MO-190 outline dimensions
- This module family is fully compliant with the latest INTEL SO-DIMM layout and electrical specification
- All PC133 modules are fully backward compatible for PC100 applications.

These INFINEON modules are industry standard 144 pin 8-byte Synchronous DRAM (SDRAM) Small Outline Dual In-line Memory Modules (SO-DIMM) which are organised as 8Mx64 (64MByte) and 16Mx64 (128MByte) high speed memory arrays designed for use in non-parity applications. These SO-DIMMs use SDRAMs in TSOPII packages. Decoupling capacitors are mounted on the board.

The DIMMs use serial presence detects implemented via a serial E²PROM using the two pin I²C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user.

All INFINEON 144-pin SO-DIMMs provide a high performance, flexible 8-byte interface in a 67,6 mm long footprint.

Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Input / Output voltage relative to V_{SS}	V_{IN}, V_{OUT}	- 1.0	4.6	V
Power supply voltage on V_{DD}	V_{DD}	- 1.0	4.6	V
Storage temperature range	T_{STG}	-55	+150	°C
Power dissipation (per SDRAM component)	P_D	–	1	W
Data out current (short circuit)	I_{OS}	–	50	mA

Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded.

Functional operation should be restricted to recommended operation conditions.

Exposure to higher than recommended voltage for extended periods of time affect device reliability

Notes:

- These parameters depend on the cycle rate. These values are measured at 133 MHz for -7/ -7.5 and 100 MHz for -8 modules. Input signals are changed once during tck, excepts for ICC6 and for standby currents when tck=infinity.
- These parameters are measured with continuous data stream during read access and all DQ toggling. CL=3 and BL=4 is assumed and the data-out current is excluded.

Notes:

1. All AC characteristics shown are for SDRAM components.
An initial pause of 100 μ s is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
2. AC timing tests have $V_{il} = 0.4$ V and $V_{ih} = 2.4$ V with the timing referenced to the 1.4 V crossover point. The transition time is measured between V_{ih} and V_{il} . All AC measurements assume $t_T = 1$ ns with the AC output load circuit shown. Specified t_{ac} and t_{oh} parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1V / ns edge rate between 0.8V and 2.0 V

..

3. If clock rising time is longer than 1ns, a time ($t_T - 0.5$) ns has to be added to this parameter.
4. If t_T is longer than 1ns, a time ($t_T - 1$) ns has to be added to this parameter.
5. Any time that the refresh Period has been exceeded, a minimum of two Auto (CRB) Refresh commands must be given to "wake-up" the device.
6. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to t_{RC} is satisfied once the Self Refresh Exit command is registered.
7. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.

Serial Presence Detects

A serial presence detect storage device - E²PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E²PROM device during module production using a serial presence detect protocol (I²C synchronous 2-wire bus)
