CMOS LDO Regulators for Portable Equipments

1ch 200mA CMOS LDO Regulators

BU☐☐TA2WNVX series, BU☐☐TA2WHFV series

No.11020ECT01

● Description

BU☐☐TA2WNVX /HFV series is high-performance FULL CMOS regulator with 200-mA output, which is mounted on microminiature package SSON004X1216 (1.2 mm × 1.6 mm × 0.6 mm) &HVSOF5(1.6mm × 1.6mm × 0.6mm). It has excellent noise characteristics and load responsiveness characteristics despite its low circuit current consumption of 40 µA. It is most appropriate for various applications such as power supplies for logic IC, RF, and camera modules.
Microminiature package SSON004X1216 & HVSOF5 with built-in heatsink is adopted for the package, which contributes to the space-saving design of the set.

● Features

1) High-accuracy output voltage of ±1% (±25 mV on 1.5-V & 1.8-V products）
2) High ripple rejection: 70 dB (Typ., 1 kHz, VOUT≤1.8 V))
3) Compatible with small ceramic capacitor (C_{IN}=Co=1.0 µF)
4) Low current consumption: 40 µA
5) ON/OFF control of output voltage
6) With built-in overcurrent protection circuit and overheat protection circuit
7) With built-in output discharge circuit
8) Adopting microminiature power package SSON004X1216

● Applications

Battery-powered portable equipment, etc.

● Line up

■ 200 mA　BU☐☐TA2WNVX / HFV series

●Absolute maximum rating

Parameter	Symbol	Ratings	Unit
Maximum applied power voltage	VMAX	-0.3 ~ +6.5	V
Power dissipation	Pd1	220[1] (SSON004X1216)	mW
	Pd2	410[2] (HVSOF5)	
Maximum junction temperature	TjMAX	+125	℃
Operational temperature range	Topr	-40 ~ +85	℃
Storage temperature range	Tstg	-55 ~ +125	℃

*1   When 1 PCB (70 mm × 70 mm, thickness 1.6-mm glass epoxy) a standard ROHM board is implemented.
       Reduced to 2.2 mW/°C when used at Ta=25°C or higher.
*2   When 1 PCB (70 mm × 70 mm, thickness 1.6-mm glass epoxy) a standard ROHM board is implemented.
       Reduced to 4.1 mW/°C when used at Ta=25°C or higher.

●Recommended operating range (Do not exceed Pd.)

Parameter	Symbol	Ratings	Unit
Input power supply voltage	VIN	2.5 ~ 5.5	V
Maximum output current	IMAX	200	mA

●Recommended operating conditions

Parameter	Symbol	Ratings			Unit	Conditions
		Min.	Typ.	Max.		
Input capacitor	CIN	0.5[3]	1.0	—	μF	A ceramic capacitor is recommended.
Output capacitor	CO	0.5[3]	1.0	—	μF	A ceramic capacitor is recommended.

*3   Set the capacity value of the capacitor so that it does not fall below the minimum value, taking temperature characteristics,
       DC device characteristics, and change with time into consideration.

●Electrical characteristics

(Unless otherwise specified   Ta=25°C, VIN=VOUT+1.0 V (VIN=3.5 V on VOUT=1.8-V and1.5-V products),
STBY=1.5 V, C$_{IN}$=1.0 µF, C$_O$=1.0 µF)

Parameter		Symbol	Limits			Unit	Conditions
			Min.	Typ.	Max.		
Output voltage		VOUT	VOUT ×0.99	VOUT	VOUT ×1.01	V	IOUT=10 µA, VOUT≥2.5 V
			VOUT -25 mV		VOUT +25 mV		IOUT=10 µA, VOUT<2.5 V

●Input/Output terminal equivalent circuit schematic

1pin (VOUT)	2pin (GND)	3pin (STBY)	4pin (VIN)
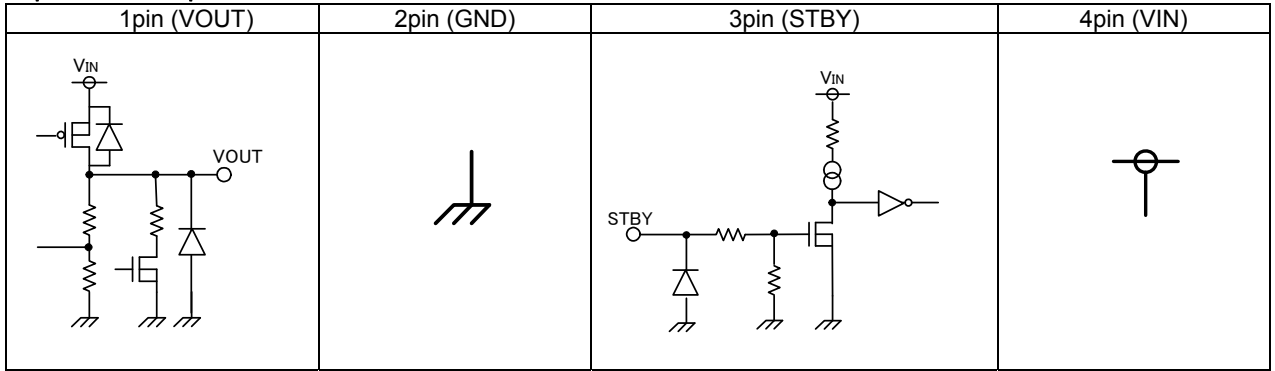

Fig. 2   Input/Output equivalent circuit

●About input/output capacitor

It is recommended to place a capacitor as close as possible to the pins between the input terminal and GND or between the output terminal and GND.

The capacitor between the input terminal and GND becomes valid when source impedance increases or when wiring is long. The larger the capacity of the output capacitor between the output terminal and GND is, the better the stability and characteristics in output load fluctuation become. However, please check the status of actual implementation. Ceramic capacitors generally have variation, temperature characteristics, and direct current bias characteristics and the capacity value also decreases with time depending on the usage conditions. It is recommended to select a ceramic capacitor upon inquiring about detailed data of the related manufacturer.

Capacity value of ceramic capacitor - DC bias characteristics (Example)
Fig.3 Capacity – bias characteristics

●About the equivalent series resistance (ESR) of a ceramic capacitor

Capacitors generally have ESR (equivalent series resistance) and it operates stably in the ESR-IOUT area shown on the right. Since ceramic capacitors, tantalum capacitors, electrolytic capacitors, etc. generally have different ESR, please check the ESR of the capacitor to be used and use it within the stability area range shown in the right graph for evaluation of the actual application.

● About power dissipation (Pd)
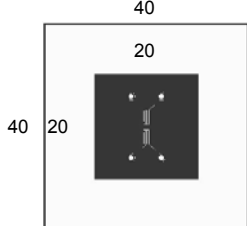

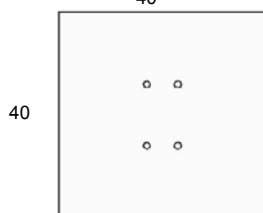

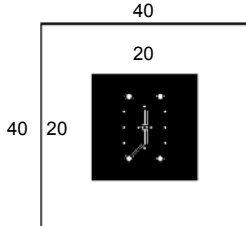

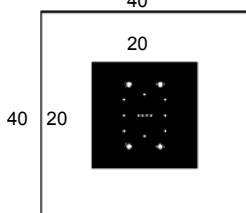

As for power dissipation, an approximate estimate of the heat reduction characteristics and internal power consumption of IC are shown, so please use these for reference. Since power dissipation changes substantially depending on the implementation conditions (board size, board thickness, metal wiring rate, number of layers and through holes, etc.), it is recommended to measure Pd on a set board. Exceeding the power dissipation of IC may lead to deterioration of the original IC performance, such as causing operation of the thermal shutdown circuit or reduction in current capability. Therefore, be sure to prepare sufficient margin within power dissipation for usage.

Calculation of the maximum internal power consumption of IC (P$_{MAX}$)

$P_{MAX}=(V_{IN}-V_{OUT})\times I_{OUT}(MAX.)$ (V$_{IN}$: Input voltage   V$_{OUT}$: Output voltage   I$_{OUT}$(MAX): Maximum output current)

Measurement conditions

		Evaluation Board 1 (Single-side Board)	Evaluation Board 2 (Double-side Board)
Layout of Board for Measurement (Unit: mm) IC Implementation Position		Top Layer (Top View) Bottom Layer (Top View)	Top Layer (Top View) Bottom Layer (Top View)
Measurement State		With board implemented (Wind speed 0 m/s)	With board implemented (Wind speed 0 m/s)
Board Material		Glass epoxy resin (Single-side board)	Glass epoxy resin (Double-side board)
Board Size		40 mm x 40 mm x 0.8 mm	40 mm x 40 mm x 0.8 mm
Wiring Rate	Top layer	Metal (GND) wiring rate: Approx. 25%	Metal (GND) wiring rate: Approx. 25%
	Bottom layer	Metal (GND) wiring rate: Approx 0%	Metal (GND) wiring rate: Approx 25%
Through Hole		0 holes	Diameter 0.5 mm × 12 holes
Power Dissipation		1100 mW	1250 mW
Thermal Resistance		θja=91°C/W	θja=80°C/W
○SSON004X1216

* Please design the margin so that P$_{MAX}$ becomes is than Pd (P$_{MAX}$<Pd) within the usage temperature range.

●Notes for use

・About absolute maximum rating
Breakage may occur when absolute maximum ratings such as applied voltage and operating temperature range are exceeded. Short mode or open mode cannot be specified at occurrence of a break, so please prepare physical safety measures (e.g., fuse) if such special mode in which the absolute maximum rating is exceeded can be assumed.

・About GND potential
Please be sure that the potential of the GND terminal is the lowest in any operating condition.

・About thermal design
Please provide thermal design with sufficient margin, taking power dissipation (Pd) in actual usage conditions into consideration.

・About short between pins and misattachment
Please be careful regarding the IC direction and misalignment at attachment onto a printed circuit board. Misattachment may cause a break of IC. Short caused by foreign matter between outputs, output and power supply, or GNDs may also lead to a break.

・About operation in a strong electromagnetic field
Please note that usage in a strong electromagnetic field may cause malfunction.

・About common impedance
Please give due consideration to wiring of the power source and GND by reducing common-mode ripple or making ripple as small as possible (e.g., making the wiring as thick and short as possible, or reducing ripple by L·C), etc.

・About STBY terminal voltage
Set STBY terminal voltage to 0.3 V or less to put each channel into a standby state and to 1.5 V or more to put each channel into an operating state. Do not fix STBY terminal voltage to 0.3 V or more and 1.5 V or less or do not lengthen the transition time. This may cause malfunction or failure. When shorting the VIN terminal and STBY terminal for usage, the status will be "STBY=VIN＝LOW" at turning the power OFF, and discharge of the VOUT terminal cannot operate, which means voltage may remain for a certain time in the VOUT terminal. Since turning the power ON again in this state may cause overshoot, turn the power ON for use after the VOUT terminal is completely discharged.

・About overcurrent protection circuit
Output has a built-in overcurrent protection circuit, which prevents IC break at load short. Note that this protection circuit is effective for prevention of breaks due to unexpected accidents. Please avoid usage by which the protection circuit operates continuously.

・About thermal shutdown
Output is OFF when the thermal circuit operates since a temperature protection circuit is built in to prevent thermal breakdown. However, it recovers when the temperature returns to a certain temperature. The thermal circuit operates at emergency such as overheating of IC. Since it is prepared to prevent IC breakdown, please do not use it in a state in which protection works.

●About reverse current
For applications on which reverse current is assumed to flow into IC, it is recommended to prepare a path to let the current out by putting a bypass diode between the VIN-VOUT terminals.
Fig.181 Example of bypass diode connection

●About testing on a set board
When connecting a capacitor to a terminal with low impedance for testing on a set board, please be sure to discharge for each process since IC may be stressed. As a countermeasure against static electricity, prepare grounding in the assembly process and take sufficient care in transportation and storage. In addition, when connecting a capacitor to a jig in a testing process, please do so after turning the power OFF and remove it after turning the power OFF.
