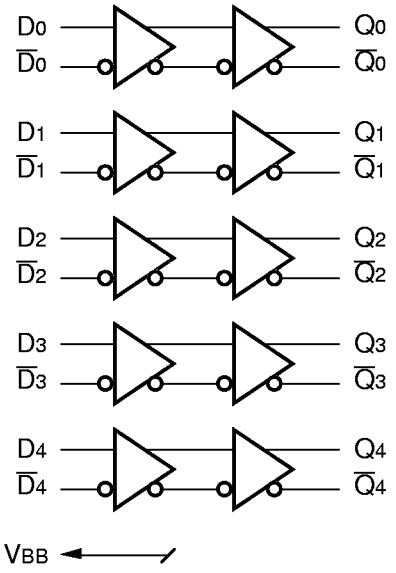
QUINT LVPECL-TO-PECL OR PECL-TO-LVPECL TRANSLATOR

FEATURES

- **3.3V and 5V power supplies required**
- **Also, supports LVPECL-to-PECL translation**
- **500ps propagation delays**
- **Fully differential design**
- **Differential line receiver capability**
- **ESD protection of 2000V**
- **Available in 28-pin PLCC package**

BLOCK DIAGRAM



FUNCTION TABLE

Function	Vcc	Vcco	Vcc_VBB
PECL-to-LVPECL	5.0V	3.3V	5.0V
LVPECL-to-PECL	5.0V	5.0V	3.3V
PECL-to-PECL	5.0V	5.0V	5.0V
LVPECL-to-LVPECL	5.0V	3.3V	3.3V

DESCRIPTION

The SY100E417 is a quint LVPECL-to-PECL translator. It can also be used as a quint PECL-to-LVPECL translator. The device receives standard PECL signals and translates them to differential LVPECL output signals (or vice versa).

The SY100E417 can also be used as a differential line receiver for PECL-to-PECL or LVPECL-to-LVPECL signals. However, please note that for the latter we will need two different power supplies. Please refer to Function Table for more details.

A V_{BB} output is provided for interfacing single ended input signals. If a single ended input is to be used, the V_{BB} output should be connected to the $\overline{D}n$ input and the active signal will drive the Dn input. When used, the V_{BB} should be bypassed to V_{CC} via a 0.01µF capacitor. The V_{BB} is designed to act as a switching reference for the SY100E417 under single ended input conditions. As a result, the pin can only source/sink 0.5mA of current.

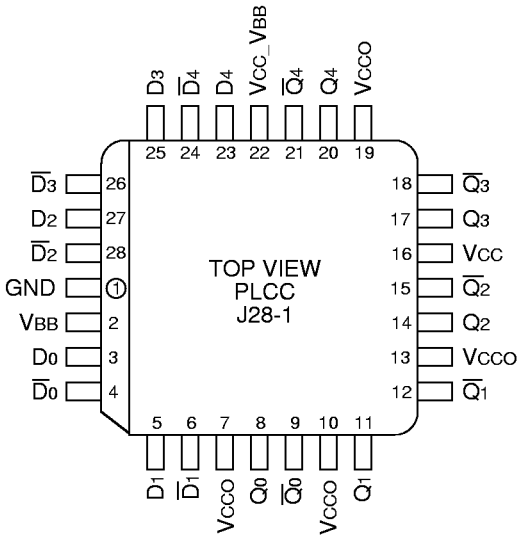
To accomplish the PECL-to-LVPECL level translation, the SY100E417 requires three power rails. The V_{CC} and V_{CC_VBB} supply is to be connected to the standard PECL supply, the 3.3V supply is to be connected to the V_{CCO} supply, and GND is connected to the system ground plane. Both the V_{CC} and V_{CCO} should be bypassed to ground with a 0.01µF capacitor.

To accomplish the LVPECL-to-PECL level translation, the SY100E417 requires three power rails as well. The 5.0V supply is connected to the V_{CC} and V_{CCO} pins, 3.3V supply is connected to the V_{CC_VBB} pin and GND is connected to the system ground plane. V_{CC_VBB} is used to provide a proper V_{BB} output level if a single ended input is used. V_{CC_VBB} = 3.3V is only required for single-ended LVPECL input. For differential LVPECL input, V_{CC_VBB} can be either 3.3V or 5.0V.

Under open input conditions, the Dn input will be biased at a $V_{CC}/2$ voltage level and the $\overline{D}n$ input will be pulled to GND. This condition will force the "Qn" output low, ensuring stability.

Rev.: B Amendment: /1
Issue Date: March, 1999

PIN CONFIGURATION



PIN NAMES

Pin	Function
Dn	PECL / LVPECL Inputs
Qn	PECL / LVPECL Outputs
VBB	Reference Voltage Output
VCCO	Vcc for Outputs
VCC_VBB	Vcc for VBB Output
GND	Common Ground Rail
VCC	Vcc for Internal Circuitry

PECL INPUT DC ELECTRICAL CHARACTERISTICS

VCC_VBB = VCC = +4.5V to +5.5V; VCCO = +3.0V to +3.8V

		TA = –40°C			TA = 0°C			TA = +25°C			TA = +85°C			
Symbol	**Parameter**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Unit**

NOTES:

1. Power supply requirements applies as indicated in the DC electrical characteristics tables.
2. Skew is measured between outputs under identical transitions.
3. Duty cycle skew is the difference between a TPLH and TPHL propagation delay through a device Common Mode Range.
4. Minimum input swing for which AC parameters are guaranteed. The device has a DC gain of ~40.
5. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP} min. and 1V.
